Data Visualization Principles And Practice Second Edition:

Data Visualization Alexandru C. Telea, 2014-09-18 Designing a complete visualization system involves many subtle decisions. When designing a complex real world visualization system such decisions involve many types of constraints such as performance, platform, dependence, available programming languages and styles, user interface toolkits, input/output data format constraints, integration with third party code and more. Focusing on those techniques and methods with the broadest applicability across fields, the second edition of *Data Visualization Principles and Practice* provides a streamlined introduction to various visualization techniques. The book illustrates a wide variety of applications of data visualizations illustrating the range of problems that can be tackled by such methods and emphasizes the strong connections between visualization and related disciplines such as imaging and computer graphics. It covers a wide range of sub topics in data visualization: data representation, visualization of scalar, vector, tensor and volumetric data, image processing and domain modeling techniques and information visualization. See What's New in the Second Edition. Additional visualization algorithms and techniques. New examples of combined techniques for diffusion tensor imaging (DTI) visualization, illustrative fiber track rendering and fiber bundling techniques. Additional techniques for point cloud reconstruction. Additional advanced image segmentation algorithms. Several important software systems and libraries. Algorithmic and software design issues are illustrated throughout by pseudo code fragments written in the C programming language. Exercises covering the topics discussed in the book as well as datasets and source code are also provided as additional online resources.

Image-Based Visualization Christophe Hurter,2022-05-31 Our society has entered a data driven era one in which not only are enormous amounts of data being generated daily but there are also growing expectations placed on the analysis of this data Some data have become simply too large to be displayed and some have too short a lifespan to be handled properly with classical visualization or analysis methods In order to address these issues this book explores the potential solutions where we not only visualize data but also allow users to be able to interact with it Therefore this book will focus on two main topics large dataset visualization and interaction Graphic cards and their image processing power can leverage large data visualization but they can also be of great interest to support interaction Therefore this book will show how to take advantage of graphic card computation power with techniques called GPGPUs general purpose computing on graphics processing units As specific examples this book details GPGPU usages to produce fast enough visualization to be interactive with improved brushing techniques fast animations between different data representations and view simplifications i e static and dynamic bundling techniques Since data storage and memory limitation is less and less of an issue we will also present techniques to reduce computation time by using memory as a new tool to solve computationally challenging problems We will investigate innovative data processing techniques while classical algorithms are expressed in data space e g computation on geographic locations we will express them in graphic space e g raster map like a screen composed of pixels This consists of two steps 1 a data representation is built using straightforward visualization techniques and 2 the resulting image undergoes purely graphical transformations using image processing techniques This type of technique is called image based visualization The goal of this book is to explore new computing techniques using image based techniques to provide efficient visualizations and user interfaces for the exploration of large datasets This book concentrates on the areas of information visualization visual analytics computer graphics and human computer interaction This book opens up a whole field of study including the scientific validation of these techniques their limitations and their generalizations to different types of datasets

Design of Visualizations for Human-Information Interaction Kamran Sedig, Paul Parsons, 2022-05-31 Interest in visualization design has increased in recent years While there is a large body of existing work from which visualization designers can draw much of the past research has focused on developing new

tools and techniques that are aimed at specific contexts Less focus has been placed on developing holistic frameworks models and theories that can guide visualization design at a general level a level that transcends domains data types users and other contextual factors In addition little emphasis has been placed on the thinking processes of designers including the concepts that designers use while they are engaged in a visualization design activity In this book we present a general holistic framework that is intended to support visualization design for human information interaction The framework is composed of a number of conceptual elements that can aid in design thinking The core of the framework is a pattern language consisting of a set of 14 basic abstract patterns and a simple syntax for describing how the patterns are blended We also present a design process made up of four main stages for creating static or interactive visualizations The 4 stage design process places the patterns at the core of designers thinking and employs a number of conceptual tools that help designers think systematically about creating visualizations based on the information they intend to represent Although the framework can be used to design static visualizations for simple tasks its real utility can be found when designing visualizations with interactive possibilities in mind in other words designing to support a human information interactive discourse This is especially true in contexts where interactive visualizations need to support complex tasks and activities involving large and complex information spaces The framework is intended to be general and can thus be used to design visualizations for diverse domains users information spaces and tasks in different fields such as business intelligence health and medical informatics digital libraries journalism education scientific discovery and others Drawing from research in multiple disciplines we introduce novel concepts and terms that can positively contribute to visualization design practice and education and will hopefully stimulate further research in this area
