[Elliptic Curve Cryptography As Suitable Solution for Mobile Devices](#) Tadeusz Struk,2010-11 Many different cryptography solutions are there to protect computers and networks but since more mobile devices are Internet capable and are being used for day to day computing there is a need for new and more efficient algorithms The modern cryptography can be divided into two main branches Symmetric Cryptography where the same key is used to encrypt a message and decrypt data Asymmetric cryptography where two different keys are used for encryption and decryption Asymmetric cryptography is much more complicated and much slower than the symmetric cryptography but it addresses the main concern of symmetric cryptography i e key exchange It allows secure communication over insecure channel like Internet This work compares the

two asymmetric algorithms RSA and ECC and investigates if ECC is more suitable e.g. faster and power efficient for mobile devices than RSA. Modern Cryptography Menachem Domb, 2019. Cyber security is taking on an important role in information systems and data transmission over public networks. This is due to the widespread use of the Internet for business and social purposes. This increase in use encourages data capturing for malicious purposes. To counteract this many solutions have been proposed and introduced during the past 80 years but Cryptography is the most effective tool. Some other tools incorporate complicated and long arithmetic calculations, vast resources consumption and long execution time resulting in it becoming less effective in handling high data volumes, large bandwidth and fast transmission. Adding to it the availability of quantum computing, cryptography seems to lose its importance. To restate the effectiveness of cryptography, researchers have proposed improvements. This book discusses and examines several such improvements and solutions.
