Transmission Network Expansion Planning For The:

The Analysis of Transmission Network Expansion Planning L. Musiqi, Goran Strbac (Prof., Supervisor.), Electrical Engineering and Electronics, 1997 **Transmission Expansion Planning: The Network Challenges of the Energy Transition** Sara Lumbreras, Hamdi Abdi, Andrés Ramos, 2020-11-19 This book presents a panoramic look at the transformation of the transmission network in the context of the energy transition It provides readers with basic definitions as well as details on current challenges and emerging technologies In depth chapters cover the integration of renewables the particularities of planning large scale systems efficient reduction and solution methods the possibilities of HVDC and super grids distributed generation smart grids demand response and new regulatory schemes The content is complemented with case studies that highlight the importance of the power transmission network as the backbone of modern energy systems This book will be a comprehensive reference that will be useful to both academics and practitioners Transmission Network Expansion Planning for Maximum Reliability Within a Specified Budget Ta-Fu Jim Ho, 1977 Transmission Network Expansion Planning Problem Considering SCC and Active Power Losses Luis A Gallego, Jesus M Lopez Lezama, Dany Huamannahui Huanca, 2022-08-23 Due to the accelerated growth of electricity demand the scarcity of primary resources to produce electricity and technological advances in recent years electricity companies must face and solve these challenges in the best possible way and for that the Transmission Network Expansion Planning TNEP plays a crucial role since the decisions taken in long term planning determine the optimal form of expansion of the networks to respond to these needs of electricity demands On the other hand there is also the tendency to leave the TNEP problem more efficient robust and closer to what happens in real electrical networks For these reasons this article proposes a methodology to solve the TNEP problem considering active power losses On the other hand is developed a modeling and solution approach to the static and multistage transmission network expansion planning problem considering series capacitive compensation and active power losses The transmission network expansion planning is formulated as a mixed integer nonlinear programming problem and solved through a highly efficient genetic algorithm Furthermore the Villasana Garver s constructive heuristic algorithm is implemented to render the configurations of the genetic algorithm feasible The installation of series capacitive compensation devices is carried out with the aim of modifying the reactance of the original circuit The linearization of active power losses is done through piecewise linear functions *Transmission Network Expansion Planning with Simulation Optimization* ,2010 Within the electric power literature the transmission expansion planning problem TNEP refers to the problem of how to upgrade an electric power network to meet future demands As this problem is a complex non linear and non convex optimization problem researchers have traditionally focused on approximate models Often their approaches are tightly coupled to the approximation choice Until recently these approximations have produced results that are straight forward to adapt to the more complex real problem However the power grid is evolving towards a state where the adaptations are no

A Method for Transmission Network Expansion Planning Zongyu Liu, 2014

Intrinsic Measures of Power System Network Performance for Transmission Expansion Planning, 2015

In a period of great uncertainty in transmission expansion planning location and types of future generation mix the work in this thesis introduces a novel approach for and an alternative to conventional transmission expansion planning TEP Current practice in TEP is dominated by scenario driven approaches that rely on assumptions for the nature and pattern of geographic placement of generation and load Such expansion futures seek transmission additions to minimize long term horizon combination of operating and capital costs while addressing anticipated reliability issues reduction in CO₂ emissions integration of renewable sources of energy among other objectives and constraints The tremendous uncertainty in future generation mix load growth technology and CO₂ emission policy is putting great strain on present practice in transmission expansion planning As a fundamentally different philosophy that draws on analogies to the network routing congestion minimization problem in data networks the work herein proposes a new paradigm for optimal transmission expansion focusing solely on properties of the transmission network itself Exploiting the special graph related eigenvalue eigenvector structure of Laplacian matrices such as the bus susceptance matrix B in a dc power flow approximation the metrics developed in this thesis are intrinsic to the network and are quantitative measures of a power system's performance In our initial contribution we adopt the condition number of the power flow Jacobian or its dc approximation the B matrix as an intrinsic measure of the robustness of transmission network independent of specific scenarios of anticipated load or generation As continuation of our work in TEP we examine the role of network Laplacian structures in TEP by extending consideration to the generalized volume of bus power injections feasible under line flow constraints We then propose a performance metric for an electric power transmission network that is again independent of specific generation load placement scenarios but seeks to maximize a global measure of a network's ability to absorb and deliver power Such metric characterizes the capacity of a transmission network to sink source power to its nodes by measuring the generalized volume of the set of feasible power injections Using perspective of the determinant as setting the volume expansion contraction for a linear operator we demonstrate in a dc power flow approximation that this measure is closely related to the magnitude of the determinant of the bus susceptance matrix Adopting Laplacian and Linear Embedding techniques we further show that this global measure of network performance is tractable easily defined analytically and yields computationally efficient algorithms for siting and sizing transmission links To further extend our work in TEP we include the role of node centrality a concept encountered in social networks which has recently found application in power

system problems Informed by our previously developed metrics of network performance we derive a centrality measure for a transmission system network that distinguishes itself from earlier centrality measures employed in the power system literature We argue that the centrality metric developed in this work is more appropriate for a TEP problem as it makes use of all paths in the network Finally in the last part of this thesis we review the important role played by non electric constraints such as geographic barriers environmental impact public stakeholder input etc in transmission expansion planning Then we introduce an approach for the inclusion of geographic decision factors in the form of line length This modification to our transmission expansion planning problem will allow one the possibility to gauge the performance of a transmission line in conjunction with the geographic length and cost associated with the construction of the line

Generation and Transmission Expansion Planning for Renewable Energy Integration, 2010 In recent years the expansion planning problem has become increasingly complex As expansion planning sometimes called composite or integrated resource planning is a non linear and

non convex optimization problem researchers have traditionally focused on approximate models of power flows to solve the problem The problem has also been split into generation expansion planning GEP and transmission network expansion planning TNEP to improve computational tractability Until recently these approximations have produced results that are straight forward to combine and adapt to the more complex and complete problem However the power grid is evolving towards a state where the adaptations are no longer easy e g large amounts of limited control renewable generation comparable generation and transmission construction costs and necessitates new approaches Recent work on deterministic Discrepancy Bounded Local Search DBLS has shown it to be quite effective in addressing the TNEP In this paper we propose a generalization of DBLS to handle simultaneous generation and transmission planning [Handbook of Power Systems I](#)

Transmission Expansion Planning

Mohammad Majidi-Qadikolai,2017 The importance of the transmission network for supplying electricity demand is undeniable and Transmission Expansion Planning TEP studies is key for a reliable power system Due to increasing sources of uncertainty such as more intermittent energy resources mobile and controllable demands and fast technology improvements for PVs and energy storage devices the need for using systematic ways for solving this complex problem is increased One of the main barriers for deploying optimization based TEP studies is computationally intractability which is the main motivation for this research The aim of this work is to investigate the computational challenges associated with systematic TEP studies for large scale problems and develop algorithms to improve computational performance In the first step we investigate the impact of adding security constraints as NERC standard requirement into TEP optimization problem and develop the Variable Contingency List VCL algorithm to pre screen security constraints to only add those that may affect the feasible region It significantly decreases the size of the problem compared to considering all security constraints Then we evaluate the impact of the size of candidate lines list number of binary variables on TEP and developed a heuristic algorithm to decrease the size of this list In the next step we integrate uncertainties into the TEP optimization problem and formulate the problem as a two stage stochastic program Adding uncertainties increases the size of the problem significantly It leads us to develop a three level filter that introduces important scenario identification index ISII and similar scenario elimination SSE technique to decrease the number of security constraints in stochastic TEP in a systematic and tractable way We then investigate the scalability of the stochastic TEP formulation We develop a configurable decomposition framework that allows us to decompose the original problem into subproblems that can be solved independently and in parallel This framework can benefit from using both progressive hedging PH and Benders decomposition BD algorithms to decompose and parallelize a large scale problem both vertically and horizontally We have also developed a bundling algorithm that improves the performance of PH algorithm and the overall performance of the framework We have implemented our work on a reduced ERCOT network with more than 3000 buses to demonstrate the practicality of the proposed method in this work for large scale problems

A Negotiation Mechanism for Incentivizing Transmission Expansion Planning Considering Generation Expansion Planning Equilibrium

Hui Guo,Yunpeng Xiao,Pierre Pinson,Xiuli Wang,Xifan Wang,2023 Whether to achieve efficient transmission expansion planning is highly dependent on the incentive mechanism while the non negligible

coordination between transmission expansion planning and generation expansion planning induces more challenges to the problem This paper proposes a negotiation mechanism for incentivizing transmission expansion planning in which both the generation companies and load serving entities are able to proactively participate in deciding on the transmission investments via negotiating directly with the transmission company who is in charge of transmission expansion planning The negotiation process is modelled based on the Nash bargaining theory while the coordination between transmission investment and generation investment is addressed with a bi level model An iterative approach is employed to solve the bi level model after transforming equivalently the upper level problem into a tractable one and devising a modified proximal message passing algorithm to seek the generation investment equilibrium in the lower level problem in a decentralized manner The feasibility and efficiency of the proposed mechanism and methodology are further justified with an IEEE 24 bus test system The results show the proposed negotiation mechanism could guarantee revenue sufficiency and achieve the social welfare maximizing transmission investment while simultaneously preserving the privacy on key information of market players coordinating the benefits conveyed to the transmission network investor and to the transmission network users as well as resulting in a reasonable allocation of transmission expansion planning costs and risks among market players Moreover the market players willingness to proactively participate in deciding on the transmission investment could be recognized with assuring increased utilities for all participants while the non cooperative feature of the generation expansion planning problem with multiple generation companies could also be captured with efficiently obtaining the equilibrium results
