analysis: in MATLAB and Excel Solver Dinesh Gupta,2014-05-01 Since the late 1940s linear programming models have been used for many different purposes Airline companies apply these models to optimize their use of planes and staff NASA has been using them for years to optimize their use of limited resources Oil companies use them to optimize their refinery operations Small and medium sized businesses use linear programming to solve a huge variety of problems often involving resource allocation In my study a typical product mix problem in a manufacturing system producing two products each product consists of two sub assemblies is solved for ist optimal solution through the use of the latest versions of MATLAB having the command `simlp` which is very much like `linprog` As analysts we try to find a good enough solution for the decision maker to make a final decision Our attempt is to give the mathematical description of the product mix optimization problem and bring the problem into a form ready to call MATLAB s `simlp` command The objective of this study is to find the best

product mix that maximizes profit The graph obtained using MATLAB commands give the shaded area enclosed by the constraints called the feasible region which is the set of points satisfying all the constraints To find the optimal solution we look at the lines of equal profit to find the corner of the feasible region which yield the highest profit This corner can be found out at the farthest line of equal profit which still touches the feasible region The most critical part is the sensitivity analysis using Excel Solver and Parametric Analysis using computer software which allows us to study the effect on optimal solution due to discrete and continuous change in parameters of the LP model including to identify bottlenecks We have examined other options like product outsourcing one time cost cross training of one operator manufacturing of hypothetical third product on under utilized machines and optimal sequencing of jobs on machines

Corporate Governance Optimisation introduces an innovative approach to addressing some of the most pressing challenges in modern corporate governance. Combining game theory, mechanism design, and hedge accounting, this research monograph offers a comprehensive framework for resolving agency conflicts, mitigating financial risks, and improving organisational performance. At the heart of this book is an integrated model that unites governance, risk management, and hedge accounting, demonstrating how these elements work together to address information asymmetry, incentive misalignment, and decision-making complexities. Grounded in rigorous research and real-life data, the book provides practical insights into how hedge accounting can stabilise financial outcomes, support effective governance, and enhance corporate value. Designed for academics, researchers, and professionals in accounting, finance, and corporate governance, this book bridges theory and practice, offering a robust foundation for understanding and applying advanced governance models. It is particularly valuable for those interested in how mathematical frameworks like game theory can be used to solve real-world corporate challenges. Spreadsheet Modeling and Decision Analysis Cliff T. Ragsdale, 1995 **Spreadsheet Modeling and Decision Analysis W/Excel** Cliff T. Ragsdale, 2000-07-01 **Statistical Thinking for Managers** David K. Hildebrand, Lyman Ott, 1998

Focusing on the analysis of data using modern statistical and spreadsheet software, Hildebrand and Ott emphasize making sense of data and discuss not only how a statistical method is applied but why and why not. Throughout the book, the authors integrate computer use into the development of statistical concepts, emphasizing the value of looking at data to make sure the right questions are being asked. The real-life applications and examples throughout challenge students to think like managers. The case that concludes every chapter asks students to deal with a relatively unstructured situation and to explain the statistical reasoning in nontechnical language. Modern statistical methods, including resampling and bootstrapping, are included. In addition, the authors emphasize quality control and improvement throughout the book and include three full chapters on regression and correlation methods.
