

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a groove which distributes seal stress in a groove with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage throughout the life cycle application. The gasket compresses to the combustion chamber to increase the sealing surface for the piston. This is done by creating a seal between the gasket and the combustion chamber. The gasket is used to seal the combustion chamber from the cooling surfaces. If the gasket sealing surface is not properly maintained through the life of the application then it will be replaced by a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many requirements therefore they must be addressed by specifying the performance of what the gasket is required to do in the application.
