*Probability* Jim Pitman, 2012-12-06 This is a text for a one quarter or one semester course in probability aimed at students who have done a year of calculus The book is organised so a student can learn the fundamental ideas of probability from the first three chapters without reliance on calculus Later chapters develop these ideas further using calculus tools The book contains more than the usual number of examples worked out in detail The most valuable thing for students to learn from a course like this is how to pick up a probability problem in a new setting and relate it to the standard body of theory The more they see this happen in class and the more they do it themselves in exercises the better The style of the text is deliberately informal My experience is that students learn more from intuitive explanations diagrams and examples than they do from theorems and proofs So the emphasis is on problem solving rather than theory *Probability* Jim Pitman, 1993-05-12

**Combinatorial Stochastic Processes** Jim Pitman, 2006-07-21 The purpose of this text is to bring graduate students specializing in probability theory to current research topics at the interface of combinatorics and stochastic processes There is particular focus on the theory of random combinatorial structures such as partitions permutations trees forests and mappings and connections between the asymptotic theory of enumeration of such structures and the theory of stochastic processes like Brownian motion and Poisson processes [Bayesian Models of Cognition](#) Thomas L. **Prior Processes and Their Applications** Eswar G. Phadia, 2016-07-27 This book presents a systematic and comprehensive treatment of various prior processes that have been developed over the past four decades for dealing with Bayesian approach to solving selected nonparametric inference problems This revised edition has been substantially expanded to reflect the current interest in this area After an overview of different prior processes it examines the now pre eminent Dirichlet process and its variants including hierarchical processes then addresses new processes such as dependent Dirichlet local Dirichlet time varying and spatial processes all of which exploit the countable mixture representation of the Dirichlet process It subsequently discusses various neutral to right type processes including gamma and extended gamma beta and beta Stacy processes and then describes the Chinese Restaurant Indian Buffet and infinite gamma Poisson processes which prove to be very useful in areas such as machine learning information retrieval and featural modeling Tailfree and Polya tree and their extensions form a separate chapter while the last two chapters present the Bayesian solutions to certain estimation problems pertaining to the distribution function and its functional based on complete data as well as right censored data Because of the conjugacy property of some of these processes most solutions are presented in closed form However the current interest in modeling and treating large scale and complex data also poses a problem the posterior distribution which is essential to Bayesian analysis is invariably not in a closed form making it necessary to resort to simulation Accordingly the book also introduces several computational procedures such as the Gibbs sampler Blocked Gibbs sampler and slice sampling highlighting essential steps of algorithms while discussing specific models In addition it features crucial steps of proofs and derivations explains the relationships between different processes and provides further clarifications to promote a deeper understanding Lastly it includes a comprehensive list of references equipping readers to explore further on their own
