Nowadays numerical computation has become one of the most vigorous tools for scientists researchers and professional engineers following the enormous progress made during the last decades in computing technology in terms of both computer hardware and software development Although this has led to tremendous achievements in computer based structural engineering the increasing necessity of solving complex problems in engineering requires the development of new ideas and innovative methods for providing accurate numerical solutions in affordable computing times This collection aims at providing a forum for the presentation and discussion of state of the art innovative developments concepts methodologies and approaches in scientific computation applied to structural engineering It involves a wide coverage of timely issues on computational structural engineering with a broad range of both research and advanced practical applications This Research Topic encompasses but is not restricted to the following scientific areas modeling in structural engineering finite element methods boundary element methods static and dynamic analysis of structures structural stability structural mechanics meshless methods smart structures and systems fire engineering blast engineering structural reliability structural health monitoring and control optimization and composite materials with application to engineering structures

*Laminated Composite Doubly-Curved Shell Structures* Francesco Tornabene,Michele Baccocchi,Nicholas Fantuzzi,Erasmus Viola,2016-05-17 The title Laminated Composite Doubly Curved Shell Structures Differential and Integral Quadrature Strong Form Finite Elements illustrates the theme treated and the prospective followed during the composition of the present work The aim of this manuscript is to analyze the static and dynamic behavior of thick and moderately thick composite shells through the application of the Differential Quadrature DQ method The book is divided into two volumes wherein the principal higher order structural theories are illustrated in detail and the mechanical behavior of doubly curved structures are presented by several static and dynamic numerical applications In particular the first volume is mainly theoretical whereas the second one is mainly related to the numerical DQ technique and its applications in the structural field The numerical results reported in the present volume are compared to the one available in the literature but also to the ones obtained through several codes based on the Finite Element Method FEM Furthermore an advanced version of the DQ method termed Strong Formulation Finite Element Method SFEM is presented The SFEM solves the differential equations inside each element in the strong form and implements the mapping technique typical of the FEM

*Advanced Composite Materials and Structures* Mohamed Thariq Hameed Sultan,Vishesh Ranjan Kar,Subrata Kumar Panda,Kandaswamy
