Learning Deep Architectures For Ai:

Learning Deep Architectures for AI Yoshua Bengio, 2009 Theoretical results suggest that in order to learn the kind of complicated functions that can represent high level abstractions e.g. in vision language and other AI level tasks one may need deep architectures. Deep architectures are composed of multiple levels of non linear operations such as in neural nets with many hidden layers or in complicated propositional formulae re using many sub formulae. Searching the parameter space of deep architectures is a difficult task but learning algorithms such as those for Deep Belief Networks have recently been proposed to tackle this problem with notable success beating the state of the art in certain areas. This paper discusses the motivations and principles regarding learning algorithms for deep architectures in particular those exploiting as building blocks unsupervised learning of single layer models such as Restricted Boltzmann Machines used to construct deeper models such as Deep Belief Networks.
