Drawing from his extensive research and expertise Salt provides a comprehensive overview of the principles behind biosensor technology and its potential impact on cancer detection This meticulously crafted book is designed to bridge the gap between theory and practice Salt explains complex concepts in a clear and accessible manner making it an ideal resource for researchers students and professionals in the fields of biomedical engineering cancer research and diagnostics The book s emphasis on practical applications ensures that readers can easily grasp the concepts and apply them to real world scenarios Readers will explore the various biosensor array models proposed by Salt and gain insights into their strengths and limitations By understanding these models researchers and clinicians can effectively design biosensor arrays tailored to specific cancer types enhancing detection accuracy and improving patient outcomes Furthermore Automated Cancer Detection via Biosensor Arrays Modeling delves into the crucial topic of automated cancer detection Salt proposes advanced machine learning algorithms that can analyze biosensor data with exceptional accuracy offering significant time and cost savings while ensuring early and reliable cancer diagnosis This groundbreaking book pushes the boundaries of cancer detection by showcasing the potential of biosensor arrays and modeling techniques Henry Salt s meticulous research and insightful analysis make this book an invaluable resource for anyone interested in the forefront of cancer diagnostics and its intersection with biosensor technology

Automated Detection and Classification of Circulating Cancer Cells Via High-throughput Microscopy Ramses Martinez Agustin,2007 Preliminary in vivo animal studies looked at what correlation exists between the number of CTCs and disease progression Routine detection of CTCs would enable physicians to observe the efficacy of treatment and modulate therapy

Automated Cancer Detection and Drug Discovery Mayank Kabra,2011 Statistical methods from machine learning have been key to the progress of computer vision in recent years Use of machine learning has led to development of many successful vision applications such as face and pedestrian detectors Along the same principles of using robust statistical methods in this thesis we build systems for two biomedical imaging domains The first system detects cancer in prostate pathology images Recent technological advancements have made it possible to commercially build whole slide scanning microscopes that generate digital images of whole slides at magnifications required for an effective clinical diagnosis The availability of digital images of pathology slides allows development of Computer Aided Diagnostic CAD tools that can improve pathologist s accuracy and efficiency in diagnosis An automated screener can assist pathologists in diagnosing by suggesting suspicious locations The screening tool can also reduce the bandwidth required for diagnosing remotely by transferring only the suspicious parts To provide a base on which such CAD tools can be developed we build a cancer detector for prostate needle core biopsies which is one of the most frequently diagnosed tissue The second system analyzes High Throughput Screening HTS images of C elegans worms to identify their phenotype HTS is a class of biological experiments where a large number of similar experiments are conducted to identify a small number of drugs or genes relevant to a biological process Recently researchers have started conducting

HTS experiments using *C. elegans* in which the experimental output are images. To assist biologists in analyzing the large number of images generated by the HTS experiments on *C. elegans*, we develop a system that identifies a worm's phenotype. A preferred way of conducting such experiments is to image the worms in agar. The shadows cast by track marks left by the worms in agar appear similar to the worms, which complicates segmenting images of worms. To reliably segment worms in such conditions, we develop a novel segmentation technique that uses multiple visual cues such as texture, contrast, and shape to segment the worms. After segmenting the worms, our system also analyzes the fluorescent patterns inside the worms to identify their phenotype.
