Robotic Navigation and Mapping with Radar Martin Adams, Martin David Adams, 2012 A practical treatment of short range radar processing for reliable object detection at ground level

A Frequency-scanned Millimeter Wave Radar for Autonomous Navigation Bryan Christopher Cattle, 2007

Synchronous Impulse Reconstruction (SIRE) Radar Sensor for Autonomous Navigation, 2006 The Army Research Laboratory ARL has designed and fabricated an impulse based ultra wideband UWB imaging radar to examine the utility of using a foliage penetrating radar with other sensors to support autonomous navigation in robotic vehicles This radar would also have application in mine detection and through the wall sensing This proof of concept radar system employs a physical array of 16 receive antennas to provide the necessary aperture for sufficient crossrange resolution in the forward looking geometry used in a robotic mission Each antenna feeds a base band receiver digitizer that integrates the data from a number of radar pulses before passing it on to the personal computer PC based operator's console and display The innovative ARL receiver design uses commercially available integrated circuits to provide a low cost lightweight digitizing scheme with an effective sampling rate of approximately 8 GHz The design is extensible to allow for growth in the number of channels used and improvements in integrated circuit performance to eventually meet the expected unmanned ground vehicle combat pace Using modules based on commercial off the shelf COTS components allows for continued expansion of capabilities of the system based on increasing capabilities of these components
