Introduction to Digital Image Processing William K. Pratt, 2013-09-13 The subject of digital image processing has migrated from a graduate to a junior or senior level course as students become more proficient in mathematical background earlier in their college education With that in mind *Introduction to Digital Image Processing* is simpler in terms of mathematical derivations and eliminates derivations of advanced s

Remote Sensing Digital Image Analysis John A. Richards, 2012-09-13 *Remote Sensing Digital Image Analysis* provides the non specialist with an introduction to quantitative evaluation of satellite and aircraft derived remotely retrieved data Since the first edition of the book there have been significant developments in the algorithms used for the processing and analysis of remote sensing imagery nevertheless many of the fundamentals have substantially remained the same This new edition presents material that has retained value since those early days along with new techniques that can be incorporated into an operational framework for the analysis of remote sensing data The book is designed as a teaching text for the senior undergraduate and postgraduate student and as a fundamental treatment for those engaged in research using digital image processing in remote sensing The presentation level is for the mathematical non specialist Since the very great number of operational users of remote sensing come from the earth sciences communities the text is pitched at a level commensurate with their background Each chapter covers the pros and cons of digital remotely sensed data without detailed mathematical treatment of computer based algorithms but in a manner conducive to an understanding of their capabilities and limitations Problems conclude each chapter

Introduction to Subsurface Imaging Bahaa Saleh, 2011-03-17 Describing and evaluating the basic principles and methods of subsurface sensing and imaging *Introduction to Subsurface Imaging* is a clear and comprehensive treatment that links theory to a wide range of real world applications in medicine biology security and geophysical environmental exploration It integrates the different sensing techniques acoustic electric electromagnetic optical x ray or particle beams by unifying the underlying physical and mathematical similarities and computational and algorithmic methods Time domain spectral and multisensor methods are also covered whilst all the necessary mathematical statistical and linear systems tools are given in useful appendices to make the book self contained Featuring a logical blend of theory and applications a wealth of color illustrations homework problems and numerous case studies this is suitable for use as both a course text and as a professional reference

Adaptive Optical Systems and Applications Robert K. Tyson, Robert Q. Fugate, 1995 Digital Image Processing Nick Efford, 2000 CD ROM contains Java classes for use in developing image processing software as well as completed image processing software *A Knowledge-based Deformable Surface Model for Analysis of Medical Images* Amir Ghanei, 2001 Medical images are challenging for segmentation Deformable models proved to be one of the most effective tools for this purpose however they still have several shortcomings and face several problems when used for images with objects that have low contrast multiple edges of other objects in their vicinity or do not have a continuous boundary in the image They also suffer in general from problems such as initialization self cutting and concave shape In this research we developed and implemented a two dimensional 2D and three dimensional 3D deformable model for analysis of medical images We used the 2D deformable model to segment structures with low contrast and multiple or discontinuous edges To do this we developed an edge tracking algorithm for external forces adaptive force weights and interpolation of energies We further developed a 2D warping model that uses this deformable contour to extract the boundaries and create a mesh map in each image using equidistance contours Thin plate splines or inverse distance weights are used for interpolation between the mesh map grids We developed a 3D deformable surface model as the extension of the deformable contour to 3D The model has a closed discrete structure based on polygonal facets We developed a method based on LSE estimation of Dupin indicatrix to calculate internal forces and use gradient based operator for external forces We remedy self cutting by extracting principal axis and performing reslicing followed by triangulation of the model We propose a method for creating the initial surface from the individual 2D contours and use multi resolution and resampling of the surface and re triangulation to further improve the model deformation The model is initialized using a rule based expert system We extended the 2D warping model to 3D The developed models have been used in several challenging applications among which segmentation of hippocampus from brain MRI and prostate from ultrasound images and the warping have been extensively investigated Comparison to manual results shows excellent model performance
