04 - MINDFULNESS-BASED COGNITIVE THERAPY (MBCT) IN THE TREATMENT OF MAJOR DEPRESSION. PRELIMINARY EVIDENCE FOR ITS EFFECTIVENESS AND MECHANISMS OF CHANGE, AN RCT STUDY. John B. Nezlek, 2017 Introduction Major Depressive Disorder MDD is a pervasive disorder estimated to be the leading cause of disability worldwide Although current treatments lead to improvement in majority of depressed individuals more needs to be

known about new therapies modalities and their mechanisms of action Although mindfulness based cognitive therapy MBCT has been found to be effective in preventing the relapse of recurrent depression it is not clear if MBCT is effective for currently depressed individuals Objectives The aim of the current research was to evaluate if MBCT can reduce depressive symptoms and to assess mechanisms underlying such changes Methods 56 individuals with a diagnosis of MDD were randomly assigned to MBCT n 26 and Waiting List n 30 conditions Prior and post 8 weeks intervention they completed questionnaires maintained a diary for 7 days and unscrambled a list of scrambled sentences as a measure of their depressive interpretation bias Scramble Sentences Test SST with eye movements being recorded during task Results We found reduction in depressive symptoms together with increase in mindfulness in MBCT group After MBCT participants perceived events as more positive and less stressful and they used significantly fewer negation and discrepancy words Moreover they made more positive interpretations in the SST than before training fixated less on negative keywords and more on positive keywords than at the pre test No such differences were found for the waiting group Conclusions These findings suggest that MBCT can be effective in treating current depression and indicate possible mechanisms underlying therapeutic change

Mindfulness-Based Cognitive Therapy for Depression Ishaan Clyde, 2025-06-26 Depression is one of the most prevalent and disabling mental health conditions worldwide Characterized by persistent feelings of sadness hopelessness and a loss of interest or pleasure in everyday activities depression significantly impairs quality of life and functional capacity Despite the availability of various pharmacological and psychological treatments a substantial proportion of individuals with depression experience recurrent episodes chronic symptoms or incomplete remission These challenges have motivated the development of innovative therapeutic approaches that address the complex nature of depression particularly its recurrent and relapsing tendencies One such approach is Mindfulness Based Cognitive Therapy MBCT a structured evidence based psychological intervention that integrates principles of cognitive therapy with mindfulness practices derived from contemplative traditions MBCT was developed in the 1990s by Zindel Segal Mark Williams and John Teasdale as a relapse prevention program for individuals with recurrent major depressive disorder MDD It was designed specifically to reduce the risk of future depressive episodes by cultivating a different relationship to thoughts emotions and bodily sensations especially those associated with depressive relapse Theoretical Foundations MBCT draws on two primary traditions Cognitive Therapy Cognitive therapy pioneered by Aaron Beck focuses on identifying and modifying maladaptive thinking patterns and cognitive distortions that contribute to emotional distress Depression is understood as partly maintained by negative automatic thoughts and dysfunctional beliefs which lead to negative mood states and behavioral withdrawal Mindfulness Meditation Mindfulness rooted in Buddhist meditation practices is the intentional and non judgmental awareness of present moment experiences including thoughts feelings and sensations Unlike rumination or avoidance mindfulness encourages observing experiences with openness and curiosity allowing for a decentered perspective that reduces emotional reactivity By

integrating these approaches MBCT aims to interrupt the habitual cognitive and emotional patterns that trigger and maintain depressive episodes

Mindfulness-based Cognitive Therapy Intervention for the Treatment of Late-life Depression and Anxiety Symptoms in Primary Care Diana Sophia Escobar Moreno, 2019 Depression and anxiety are disabling psychiatric conditions worldwide Approximately 10-20% of older adults treated in primary care settings suffer from late life depression LLD and or late life anxiety LLA Older adults are often undertreated and or do not receive the appropriate treatment for LLD and or LLA in primary care due to the lack of available resources and high demands on the health care system Evidence has shown that antidepressants are the first line of treatment for LLD and LLA in older adults in primary care settings Typically the geriatric population does not respond well to psychotropic medication due to comorbidities with other illnesses and polypharmacy leading to high readmission rates As the population ages the number of older adults treated in primary care increases therefore there is an urgent need to find effective scalable and potentially cost effective alternative therapies This study examined the potential benefit that Mindfulness Based Cognitive Therapy MBCT may have on the symptoms of LLD and or LLA in older adults compared to treatment as usual TAU A sample of 61 older adults age 67-86 years with symptoms of depression and or anxiety were randomized to MBCT or TAU in a primary care setting Primary outcomes measured a post pre change in depression symptoms PHQ-9 The secondary outcome examined a post pre changes in anxiety symptoms GAD-7 anxiety scores Exploratory outcomes included a post pre changes in health related quality of life and quality of sleep The study also aimed to assess feasibility acceptability and tolerability of the MBCT intervention with the geriatric population Results from this study showed that participants in the MBCT group compared to TAU significantly improved in depressive and anxiety

symptoms scores as well in the health related quality of life scores The MBCT intervention was feasible with an enrollment rate of 80.3% and an intervention completion rate of 78% The MBCT intervention was acceptable with a study retention rate of 87% Most of the participants found the MBCT intervention tolerable enjoying the mindfulness meditation intervention especially the guided meditations In conclusion the MBCT intervention may potentially benefit and give an alternative treatment for older adults in primary care suffering from depression and or anxiety symptoms Implementing these types of evidence based therapies could target more people at once and reduce the amount of staff required which may potentially lead to less costs overall To our knowledge this is the first well controlled RCT study in the field using MBCT for older adults with symptoms of depression and or anxiety in primary care Future studies are needed to replicate and to evaluate the effects of MBCT while using an active control group The long term effects of MBCT must also be studied as well as studies implementing more formal systematic diagnostic when assessing depression and or anxiety in this population
