Nonlinear Ordinary Differential Equations Martin Hermann,Masoud Saravi,2016-05-09 The book discusses the solutions to nonlinear ordinary differential equations ODEs using analytical and numerical approximation methods Recently analytical approximation methods have been largely used in solving linear and nonlinear lower order ODEs It also discusses using these methods to solve some strong nonlinear ODEs There are two chapters devoted to solving nonlinear ODEs using numerical methods as in practice high dimensional systems of nonlinear ODEs that cannot be solved by analytical approximate methods are common Moreover it studies analytical and numerical techniques for the treatment of parameter depending ODEs The book explains various methods for solving nonlinear oscillator and structural system problems including the energy balance method harmonic balance method amplitude frequency formulation variational iteration method homotopy perturbation method iteration perturbation method homotopy analysis method simple and multiple shooting method and the nonlinear stabilized march method This book comprehensively investigates various new analytical and numerical approximation techniques that are used in solving nonlinear oscillator and structural system problems Students often rely on the finite element method to such an extent that on graduation they have little or no knowledge of alternative methods of solving problems To rectify this the book introduces several new approximation techniques

Solving Transcendental Equations John P. Boyd, 2014-09-23
Transcendental equations arise in every branch of science and engineering While most of these equations are easy to solve some are not and that is where this book serves as the mathematical equivalent of a skydiver's reserve parachute not always needed but indispensable when it is The author's goal is to teach the art of finding the root of a single algebraic equation or a pair of such equations

Transportation Systems 1997 (TS'97) Markos Papageorgiou, A. D. Pouliezios, 1997 This Symposium was the 8th in the series of planned IFAC Symposia on Transportation Systems The International Program Committee received over 400 papers from the international transportation community Road Traffic was the most popular subject with over 190 abstracts followed by Intermodal and Freight Public Transport Rail and Maritime Transport and Air Traffic Transportation of people and goods has been necessary for society for thousands of years In modern times transportation by road rail air and sea has become a fundamental component of human activity A great number of technical economic environmental and organizational problems related to traffic and transportation have been ingeniously resolved in the past and perhaps an even higher number of problems will have to be overcome in the future Recently it has been realized more and more that problems connected to transportation traffic congestion and delay cannot be resolved by simply extending the available infrastructure Efficient use of existing facilities is a feasible alternative which becomes possible by the application of concepts and methods provided by systems and information theory Besides recent developments in digital computer and communication technology provide the necessary practical tools for satisfactory and cheap solutions The papers in this volume reflect these ideas and the current diversity and dynamism of the field as a whole

as a central issue here and industrial users require the development of modelling languages for both analyses and design as well as generic models and tools which can be used for system identification optimisation and fault diagnostics Linear lumped parameter systems of general complexity are currently well addressed by a range of commercially available packages However there is a dearth of tools suitable for the analysis and synthesis of large scale distributed non linear hybrid and stochastic systems which are increasingly a feature in modern manufacturing and process engineering As the scale of the problems to be addressed increases there is a need for numerically robust and efficient computational procedures linked to powerful interactive graphical interfaces which maximise the user of limited human resources and of course standardised data bases which can be used with wide range of analysis and design procedures Topics covered included the now traditional domains of algorithm architectures and tools and there was a very welcome emphasis on applications where no less than four sessions were devoted to this important aspect
