According to a widely accepted forecast the world reserve of crude oil known and to be explored is about 360 Gt. The global oil demand in the 21st century however will be roughly 250-260 Gt, thus the recovery factor must be doubled from 30-35% at present to 65-70% on average to meet the predicted global demand. Unfortunately more than 70% of the worldwide oil and gas production comes from depleted reservoirs. Consequently revitalization of matured oil and gas fields has priority as part of the availability of hydrocarbons. Implementation of novel IOR/EOR technologies and stimulation and optimization of well performance while minimizing the environmental impacts will form the main stream of developments in the coming years and decades. Necessarily the R & D activity will and must be strengthened in the future putting the oil and gas industry on a new pedestal. This book demonstrates the recent contributions of research projects to oilfield chemistry and advanced production techniques.
