NUMBER & CHARACTER

Integer
 The integer data type represents whole numbers. It is the most basic of the numeric types. The range of values that can be stored in an integer depends on the implementation, but it is typically between -2,147,483,648 and 2,147,483,647. The integer type is used for counting, indexing, and other operations that require whole numbers.

Float
 The float data type represents real numbers. It is used for calculations that require fractional values. The range of values that can be stored in a float is typically between -3.4e+38 and 3.4e+38. The float type is used for scientific calculations, financial calculations, and other operations that require fractional values.

Double
 The double data type represents real numbers with higher precision than float. It is used for calculations that require high precision. The range of values that can be stored in a double is typically between -1.7e+308 and 1.7e+308. The double type is used for scientific calculations, financial calculations, and other operations that require high precision.

Character
 The character data type represents a single character. It is used for storing and manipulating individual characters. The range of values that can be stored in a character is typically between 0 and 255. The character type is used for string processing, file I/O, and other operations that require individual characters.

String
 The string data type represents a sequence of characters. It is used for storing and manipulating text. The range of values that can be stored in a string depends on the implementation, but it is typically between 0 and 255. The string type is used for text processing, file I/O, and other operations that require text.

Boolean
 The boolean data type represents a logical value. It is used for storing and manipulating true and false values. The range of values that can be stored in a boolean is typically between 0 and 1. The boolean type is used for conditional statements, loops, and other operations that require logical values.

Enum
 The enum data type represents a set of named constants. It is used for storing and manipulating discrete values. The range of values that can be stored in an enum depends on the implementation, but it is typically between 0 and 255. The enum type is used for representing categories, states, and other discrete values.

Complex
 The complex data type represents complex numbers. It is used for calculations that require complex numbers. The range of values that can be stored in a complex number depends on the implementation, but it is typically between -1e+308 and 1e+308. The complex type is used for scientific calculations, signal processing, and other operations that require complex numbers.

Vector
 The vector data type represents a sequence of elements. It is used for storing and manipulating collections of data. The range of values that can be stored in a vector depends on the implementation, but it is typically between 0 and 255. The vector type is used for arrays, lists, and other collections of data.

Matrix
 The matrix data type represents a two-dimensional array of elements. It is used for storing and manipulating collections of data. The range of values that can be stored in a matrix depends on the implementation, but it is typically between 0 and 255. The matrix type is used for image processing, scientific calculations, and other operations that require two-dimensional data.

Array
 The array data type represents a collection of elements of the same type. It is used for storing and manipulating collections of data. The range of values that can be stored in an array depends on the implementation, but it is typically between 0 and 255. The array type is used for lists, tables, and other collections of data.

Map
 The map data type represents a collection of key-value pairs. It is used for storing and manipulating collections of data. The range of values that can be stored in a map depends on the implementation, but it is typically between 0 and 255. The map type is used for dictionaries, hash tables, and other collections of data.

Set
 The set data type represents a collection of unique elements. It is used for storing and manipulating collections of data. The range of values that can be stored in a set depends on the implementation, but it is typically between 0 and 255. The set type is used for lists, tables, and other collections of data.

Queue
 The queue data type represents a collection of elements that are added and removed in a specific order. It is used for storing and manipulating collections of data. The range of values that can be stored in a queue depends on the implementation, but it is typically between 0 and 255. The queue type is used for lists, tables, and other collections of data.

Stack
 The stack data type represents a collection of elements that are added and removed in a specific order. It is used for storing and manipulating collections of data. The range of values that can be stored in a stack depends on the implementation, but it is typically between 0 and 255. The stack type is used for lists, tables, and other collections of data.
