A Framework To Design And Optimize Chemical Flooding Processes:

A FRAMEWORK TO DESIGN AND OPTIMIZE CHEMICAL FLOODING PROCESSES. ,2005 The goal of this proposed research is to provide an efficient and user friendly simulation framework for screening and optimizing chemical microbial enhanced oil recovery processes The framework will include 1 a user friendly interface to identify the variables that have the most impact on oil recovery using the concept of experimental design and response surface maps 2 UTCHEM reservoir simulator to perform the numerical simulations and 3 an economic model that automatically imports the simulation production data to evaluate the profitability of a particular design Such a reservoir simulation framework is not currently available to the oil industry The objectives of Task 1 are to develop three primary modules representing reservoir chemical and well data The modules will be interfaced with an already available experimental design model The objective of the Task 2 is to incorporate UTCHEM reservoir simulator and the modules with the strategic variables and developing the response surface maps to identify the significant variables from each module The objective of the Task 3 is to develop the economic model designed specifically for the chemical processes targeted in this proposal and interface the economic model with UTCHEM production output Task 4 is on the validation of the framework and performing simulations of oil reservoirs to screen design and optimize the chemical processes

chemical flooding simulator called UTCHEM During the study UT_IRSP and UTCHEM have been modified by adding new modules functions and variables For example a deviated well module was implemented in UTCHEM to study deviated wells Deviated well module allows the users to introduce deviated wells in reservoir and import the well locations similar to Eclipse or CMG simulators A time dependent well schedule module was implemented in the UT_IRSP framework This enhancement allows the well placement optimization studies to find the best time to add new wells and change the status of the well for example from a producer to an injector in order to have an optimum development plan An advanced post processing module was added to UT_IRSP in order to design screen and optimize complex cases for chemical enhanced oil recovery processes such as investigating the well patterns well spacing and type of the well horizontal vs vertical wells An experimental design and response surface methodology with integrated economic model were utilized in this study to obtain the optimum design under uncertainties and have an optimal combination of the decision variables This methodology is based on applying multi regression analysis and ANOVA analysis of variance between the objective function i e dependent variable which is net present value NPV in chemical flooding and other uncertain and process variables independent variables The economic analysis model used the discounted cash flow method to calculate net present value at the economic life of process internal rate of return and growth rate of return for each simulation case Also the optimizer OptQuest is launched with a goal of maximizing the mean NPV The range and the risk associated with the optimum design was studied using Monte Carlo simulation of objective function of the response variable and other independent variables This methodology was applied for complex chemical flood cases such as well placement change of status of wells as a function of time or well pattern and well spacing to investigate the best well scenario from recovery and economics point of view *Journal of Petroleum Technology* ,1972 *Dissertation Abstracts International* ,2005 **Selected Water Resources Abstracts** ,1976 *Petroleum Abstracts.
