Schütze, David Butler, Bruce M. Beck, 2011-06-27 by Professor Poul Harremoes Environmental engineering has been a discipline dominated by empirical approaches to engineering Historically speaking the development of urban drainage structures was very successful on the basis of pure empiricism Just think of the impressive structures built by the Romans long before the discipline of hydraulics came into being The fact is that the Romans did not know much about the theories of hydraulics which were discovered as late as the mid 1800s However with the Renaissance came a new era Astronomy Galileos and basic physics Newton started the scientific revolution and in the mid 1800s Navier and Stokes developed the application of Newtons laws to hydrodynamics and later St Venant the first basic physics description of the motion of water in open channels The combination of basic physical understanding of the phenomena involved in the flow of water in pipes and the experience gained by trial and error the engineering approach to urban drainage improved the design and performance of the engineering drainage infrastructure However due to the mathematical complications of the basic equations solutions were available only to quite simple cases of practical significance until the introduction of new principles of calculation made possible by computers and their ability to crunch numbers Now even intricate hydraulic phenomena can be simulated with a reasonable degree of confidence that the simulations are in agreement with performance in practice if the models are adequately calibrated with sample performance data [Simulink Dynamic System Simulation for MATLAB Using SIMULINK](#) Math Works, 2000 *Manufacturing Engineering and Automation II* Liang Chi Zhang, Chun Liang Zhang, Jeng Haur Horng, Zi Chen Chen, 2012-11-29 Selected peer reviewed papers from the 2012 International Conference on Manufacturing Engineering and Automation ICMEA 2012 November 16 18 2012 Guangzhou China **Proceedings of the AIAA Modeling and Simulation Technologies Conference** American Institute of Aeronautics and Astronautics, 1997 Topics for the 1997 conference on modelling and simulation technologies included motion systems rotor craft and air cushion vehicle dynamics and modelling pilot training and low cost simulation weapons and engagement modelling and simulation simulator network and information technologies visual radarf and environmental modelling and simulation test and evaluation space systems simulator fidelity aircraft dynamics modelling and performance simulator development and software re use human factors and research and test facilities **Modeling and Computer Simulation of Internal Combustion Engines** , 1999 [Advanced Research on Intelligent System, Mechanical Design Engineering and Information Engineering III](#) Helen Zhang, David Jin, X.J. Design Optimization of the Electrically Peaking Hybrid (ELPH) Vehicle M. Ehsani,Yimin Gao,K. Butler,1998 Electrically Peaking Hybrid ELPH is a parallel hybrid electric vehicle propulsion concept that was invented at Texas A M University by the advanced vehicle systems research group Over the past six years design methodologies component development and system optimization work has been going on for this invention This project was a first attempt in integrating the above developments into an optimized design of an ELPH passenger car Design specifications were chosen for a full size passenger car performing as well as any conventional car over the EPA FTP 75 combined city highway drive cycles The results of this design project were two propulsion systems Both were appropriate for commercial production from the point of view of cost availability of the technologies and components One utilized regenerative braking and the other did not Substantial fuel savings and emissions reductions resulted from simulating these designs on the FTP 75 drive cycle For example our ELPH full size car with regenerative braking was capable of delivering over 50 miles per gallon in city driving with corresponding reductions in its emissions This project established the viability of the ELPH concept and the design methodologies in computer simulations More work remains to be done on investigating more advanced power plants such as fuel cells and more advanced components such as switched reluctance motor drives for the designs Furthermore the design optimization can be carried out to more detailed levels for prototyping and production
