ABSTRACT This paper proposes a new observer-based model-free adaptive sliding mode predictive control method (MFASPC) for discrete-time nonlinear systems. This scheme first equates the discrete-time nonlinear system to a linear form using a data-driven compact form dynamic linearization (CFDL) technique, establishes a data model consisting of only the pseudo partial derivatives (PPD), input data and output data, designs adaptive observers to achieve the estimation of the unknown PPD. The controller design part uses integral sliding mode control (SMC) to ensure the system's robustness. In contrast, with its constraint characteristics, the model predictive control (MPC) replaces the traditional switching control of SMC. The closed-loop control quantities are obtained by solving a rolling optimization problem in the finite time domain to provide dynamic optimal control action. The theoretical derivation of the Lyapunov function is used to demonstrate the system's stability. In order to verify the effectiveness of the proposed algorithm, numerical simulations and Photovoltaic power generation system simulation experiments are conducted, respectively, and the results show that the proposed control algorithm has a very reliable tracking capability and control accuracy.

I. INTRODUCTION

IN recent years, adaptive control techniques for nonlinear systems have attracted a large number of scholars and much effort has been devoted to them [1]–[3]. However, most methods require dynamical or mechanistic analysis of the control system to obtain an accurate mathematical model first, and there are inevitably approximation links throughout the process [4]. In contrast, the ignored unmodeled dynamics part may be a potential factor that makes the closed-loop system unstable and reduces the controller performance.

Model-free adaptive control (MFAC) is a data-driven control method for discrete-time nonlinear systems to improve modeling difficulties [5], and its most important features compared to other data-driven control methods are the equivalent dynamic linearization process and the introduction of virtual parameters (PPD). MFAC uses the input and output data of the system to update the

virtual parameters online dynamically, thus establishing an equivalent data model, both the PPD and the data model, which depend merely on the data and are unrelated to the structural information of the system, thus thoroughly characterizing the nonlinear and uncertain features of the system [6]. It has been widely used in the past few years, such as urban traffic control, heading control, zero-sum game control, flexible joint control, etc. [7]–[10].

As the research progresses, to further solve the uncertainty problem of the control system and ensure robust performance in control, some scholars bring the SMC into the MFAC algorithm to carry out the research, which produces the model-free adaptive sliding mode control (MFASMC) scheme. Among them, the sliding phase of the SMC law ensures the excellent stability performance of the system, and the arrival phase determines the system's dynamic performance. For example, [11]

Recent Advances in Model Predictive Control Timm Faulwasser, Matthias A. Müller, Karl Worthmann, 2021-04-17 This book focuses on distributed and economic Model Predictive Control MPC with applications in different fields MPC is one of the most successful advanced control methodologies due to the simplicity of the basic idea measure the current state predict and optimize the future behavior of the plant to determine an input signal and repeat this procedure ad infinitum and its capability to deal with constrained nonlinear multi input multi output systems While the basic idea is simple the rigorous analysis of the MPC closed loop can be quite involved Here distributed means that either the computation is distributed to meet real time requirements for very large scale systems or that distributed agents act autonomously while being coupled via the constraints and or the control objective In the latter case communication is necessary to maintain feasibility or to recover system wide optimal performance The term economic refers to general control tasks and thus goes beyond the typically predominant control objective of set point stabilization Here recently developed concepts like strict dissipativity of optimal control problems or turnpike properties play a crucial role The book collects research and survey articles on recent ideas and it provides perspectives on current trends in nonlinear model predictive control Indeed the book is the outcome of a series of six workshops funded by the German Research Foundation DFG involving early stage career scientists from different countries and from leading European industry stakeholders

Trajectory tracking, path following, and learning in model predictive control Fabian Russell Pfitz,2023-08-21 In this thesis we present novel model predictive control MPC formulations based on a convex open loop optimal control problem to tackle the problem setup of trajectory tracking and path following as well as the control of systems with unknown system dynamic In particular we consider the framework of relaxed barrier function based MPC rbMPC We extend the existing stability theory to the trajectory tracking and the path following problem We establish important system theoretic properties like closed loop stability and exact constraint satisfaction under suitable assumptions Moreover we evaluate the developed MPC algorithms in the area of automated driving in simulations as well as in a real world driving scenario Further we consider the control of completely unknown systems based on online optimization We divide the overall problem into the design of an estimation algorithm and a control algorithm The control algorithm is a model independent receding horizon control algorithm in which important system theoretic properties like convergence to the origin are guaranteed without the knowledge of the true system parameters The estimation and control algorithm are combined together and convergence to the origin of the closed loop system for fully unknown linear time invariant discrete time systems is shown

Advanced Model Predictive Control Bianca Lupei,2016 Model predictive control is an advanced method of process control that has been in use in the process industries in chemical plants and oil refineries since the 1980s In recent years it has also been used in power system balancing models Model predictive controllers rely on dynamic models of the process most often linear empirical models obtained by system identification The main advantage of model predictive control is the fact that it allows the current timeslot to be optimized while keeping future timeslots in account This is achieved by optimizing a finite time horizon but only implementing the current timeslot Model predictive control has the ability to anticipate future events and can take control actions accordingly MPC models predict the change in the dependent variables of the modelled system that will be caused by changes in the independent variables In a chemical process independent variables that can be adjusted by the controller are often either the setpoints of regulatory PID controllers or the manual control element Independent variables that cannot be adjusted by the controller are used as disturbances Dependent variables in these processes are other measurements that represent either control objectives or process constraints The book entitled *Advanced Model Predictive Control* is intended to present the readers the recent achievements in this field The book also delivers applications of MPC in modern industry and effective commercial software for MPC is familiarized *Gradient-based Nonlinear Model Predictive Control with Constraint Transformation for Fast Dynamical Systems* Bartosz Maciej Käpernick,2016 **Data-driven Subspace-based Model Predictive Control** Noor Azizi Mardi,2010
