[Building Your Own Compiler with C++](#) Jim Holmes, 1995 Holmes satisfies the dual demand for an introduction to compilers and a hands on compiler construction project manual in *The Object Oriented Compiler Workbook* This book details the construction process of a fundamental yet functional compiler so that readers learn by actually doing It uses C as the implementation language the most popular Object Oriented language and compiles a tiny subset of Pascal resulting in source language constructs that are already a part of most readers experience It offers extensive figures detailing the behavior of the compiler especially as it relates to the parse tree It supplies complete source codes for example compiler listed as an appendix and available by FTP

[Build Your Own Programming Language](#) Clinton L. Jeffery, 2021-12-31 Written by the creator of the Unicon programming language this book will show you how to implement programming languages to reduce the time and cost of creating applications for new or specialized areas of computing Key Features Reduce development time and solve pain points in your application domain by building a custom programming language Learn how to create parsers code generators file readers analyzers and interpreters Create an alternative to frameworks and libraries to solve domain specific problems Book Description The need for different types of computer languages is growing rapidly and developers prefer creating domain specific languages for solving specific application domain problems Building your own programming language has its advantages It can be your antidote to the ever increasing size and complexity of software In this book you ll start with implementing the frontend of a compiler for your language including a lexical analyzer and parser The book covers a series of traversals of syntax trees culminating with code

generation for a bytecode virtual machine Moving ahead you'll learn how domain specific language features are often best represented by operators and functions that are built into the language rather than library functions We'll conclude with how to implement garbage collection including reference counting and mark and sweep garbage collection Throughout the book Dr Jeffery weaves in his experience of building the Unicon programming language to give better context to the concepts where relevant examples are provided in both Unicon and Java so that you can follow the code of your choice of either a very high level language with advanced features or a mainstream language By the end of this book you'll be able to build and deploy your own domain specific languages capable of compiling and running programs What you will learn Perform requirements analysis for the new language and design language syntax and semantics Write lexical and context free grammar rules for common expressions and control structures Develop a scanner that reads source code and generate a parser that checks syntax Build key data structures in a compiler and use your compiler to build a syntax coloring code editor Implement a bytecode interpreter and run bytecode generated by your compiler Write tree traversals that insert information into the syntax tree Implement garbage collection in your language Who this book is for This book is for software developers interested in the idea of inventing their own language or developing a domain specific language Computer science students taking compiler construction courses will also find this book highly useful as a practical guide to language implementation to supplement more theoretical textbooks Intermediate level knowledge and experience working with a high level language such as Java or the C language are expected to help you get the most out of this book
