EBOOK: Applied Numerical Methods with MATLAB for Engineers and Scientists Steven Chapra, 2011-05-16

Steven Chapra's Applied Numerical Methods with MATLAB third edition is written for engineering and science students who need to learn numerical problem solving. Theory is introduced to inform key concepts which are framed in applications and demonstrated using MATLAB. The book is designed for a one semester or one quarter course in numerical methods typically taken by undergraduates. The third edition features new chapters on Eigenvalues and Fourier Analysis and is accompanied by an extensive set of m files and instructor materials.

Applied Numerical Methods Using MATLAB Won Y. Yang, Wenwu Cao, Jaekwon Kim, Kyung W. Park, Ho-Hyun Park, Jingon Joung, Jong-Suk Ro, Han L. Lee, Cheol-Ho Hong, Taeho Im, 2020-05-12

This new edition provides an updated approach for students, engineers, and researchers to apply numerical methods for solving problems using MATLAB. This accessible book makes use of MATLAB software to teach the fundamental concepts for applying numerical methods to solve practical engineering and or science problems. It presents programs in a complete form so that readers can run them instantly with no programming skill, allowing them to focus on understanding the mathematical manipulation process and making interpretations of the results.

Applied Numerical Methods Using MATLAB Second Edition begins with an introduction to MATLAB usage and computational errors covering everything from input/output of data to various kinds of computing errors and on to parameter sharing and passing and more. The system of linear equations is covered next, followed by a chapter on interpolation by Lagrange polynomial. The next sections look at interpolation and curve fitting, nonlinear equations, numerical differentiation, integration, ordinary differential equations, and optimization. Numerous methods such as the Simpson, Euler, Heun, Runge-Kutta, Golden Search, Nelder-Mead, and more are all covered in those chapters. The eighth chapter provides readers with matrices and Eigenvalues and Eigenvectors. The book finishes with a complete overview of differential equations. Provides examples and problems of solving electronic circuits and neural networks. Includes new sections on adaptive filters, recursive least squares estimation, Bairstow's method for a polynomial equation, and more. Explains Mixed Integer Linear Programming (MILP) and DOA (Direction of Arrival) estimation with eigenvectors. Aimed at students who do not like and or do not have time to derive and prove mathematical results.

Applied Numerical Methods Using MATLAB Second Edition is an excellent text for students who wish to develop their problem solving capability without being involved in details about the MATLAB codes. It will also be useful to those who want to delve deeper into understanding underlying algorithms and equations.

Introduces the reader to chemical engineering computation without the distractions caused by the contents found in many texts. Provides the principles underlying all of the major processes a chemical engineer may encounter as well as offers insight into their analysis which is essential for design calculations. Shows how to solve chemical engineering problems using computers that require numerical methods using standard algorithms such as MATLAB and Excel. Contains selective solved examples of many problems within the chemical process industry to demonstrate how to solve them using the techniques presented in the text. Includes a variety of case studies to illustrate the concepts and a downloadable file containing fully worked solutions to problems on the publisher's website. Offers non-chemical engineers who are expected to work with chemical engineers on projects, scale-ups and process evaluations a solid understanding of basic concepts of chemical engineering analysis, design and calculations.

Applied Numerical Methods for Engineers Using MATLAB and C Robert Joseph Schilling, Sandra L. Harris, 2000. This book provides a comprehensive discussion of numerical computing techniques with an emphasis on practical applications in the fields of civil, chemical, electrical and mechanical engineering. It features two software libraries that implement the algorithms developed in the text: a MATLAB toolbox and an ANSI C library. This book is intended for undergraduate students. Each chapter includes detailed case study examples from the four engineering fields with complete solutions provided in MATLAB and C, detailed objectives, numerous worked-out examples and illustrations, and summaries comparing the numerical techniques. Chapter problems are divided into separate analysis and computation sections. Documentation for the software is provided in text appendixes that also include a helpful review of vectors and matrices. The Instructor's Manual includes a disk with software documentation and complete solutions to both problems and examples in the book. *Journal of the American Statistical Association*, 2001.
