Complexity And Approximation Combinatorial Optimization Problems And Their Approximability Properties:

Complexity and Approximation, 1999 *Complexity and Approximation* Giorgio Ausiello, Pierluigi Crescenzi, Giorgio Gambosi, Viggo Kann, Alberto Marchetti-Spaccamela, Marco Protasi, 2012-12-06

N COMPUTER applications we are used to live with approximation Various notions of approximation appear in fact in many circumstances One notable example is the type of approximation that arises in numerical analysis or in computational geometry from the fact that we cannot perform computations with arbitrary precision and we have to truncate the representation of real numbers In other cases we use to approximate complex mathematical objects by simpler ones for example we sometimes represent non linear functions by means of piecewise linear ones The need to solve difficult optimization problems is another reason that forces us to deal with approximation In particular when a problem is computationally hard i e the only way we know to solve it is by making use of an algorithm that runs in exponential time it may be practically unfeasible to try to compute the exact solution because it might require months or years of machine time even with the help of powerful parallel computers In such cases we may decide to restrict ourselves to compute a solution that though not being an optimal one nevertheless is close to the optimum and may be determined in polynomial time We call this type of solution an approximate solution and the corresponding algorithm a polynomial time approximation algorithm Most combinatorial optimization problems of great practical relevance are indeed computationally intractable in the above sense In formal terms they are classified as NP hard optimization problems

Complexity and Approximation Giorgio Ausiello, Pierluigi Crescenzi, Giorgio Gambosi, Viggo Kann, Alberto Marchetti-Spaccamela, Marco Protasi, 2002-12-03 This book documents the state of the art in combinatorial optimization presenting approximate solutions of virtually all relevant classes of NP hard optimization problems The wealth of problems algorithms results and techniques make it an indispensable source of reference for professionals The text smoothly integrates numerous illustrations examples and exercises

Mathematical Foundations of Computer Science 2004 Jirí Fiala, Václav Koubek, Jan Kratochvíl, 2004-08-09 This volume contains the papers presented at the 29th Symposium on Mathematical Foundations of Computer Science MFCS 2004 held in Prague Czech Republic August 22-27 2004 The conference was organized by the Institute for Theoretical Computer Science ITI and the Department of Theoretical Computer Science and Mathematical Logic KTIML of the Faculty of Mathematics and Physics of Charles University in Prague It was supported in part by the European Association for Theoretical Computer Science EATCS and the European Research Consortium for Informatics and Mathematics ERCIM Traditionally the MFCS symposia encourage high quality research in all branches of theoretical computer science Ranging in scope from automata formal languages data structures algorithms and computational geometry to complexity theory models of computation and applications including computational biology cryptography security and artificial intelligence the conference offers a unique opportunity to researchers from diverse areas to meet and present their results to a general audience The scientific program of this year's MFCS took place in the lecture

halls of the recently reconstructed building of the Faculty of Mathematics and Physics in the historical center of Prague with the famous Prague Castle and other celebrated historical monuments in sight. The view from the windows was a challenging competition for the speakers in the night for the attention of the audience. But we did not fear the result. Due to the unusually tough competition for this year's MFCS the admitted presentations certainly attracted considerable interest. The conference program and the proceedings consisted of 60 contributed papers selected by the Program Committee from a total of 167 submissions.

Development of an Algorithm for the Taktline Layout of Synchronized Job Shop Production Antonia Fels, 2019-03-11 In job shop production the change towards synchronized job shop production which is based on the concept of so called taktlines has been shown to enhance efficiency. In this dissertation an algorithm for the taktline layout is developed following a multi objective approach. The algorithm consists of two sequential discrete optimization problems namely a modified Substring Cover Problem and a partitioning Cluster Analysis including a Multiple Sequence Alignment. For an overall validation real world data from tool manufacturers are subject to the proposed algorithm.
