**Nonlinear Control and Analytical Mechanics** Harry G. Kwatny, Gilmer Blankenship, 2000-09-08 During the past decade we have had to confront a series of control design problems involving primarily multibody electro mechanical systems in which nonlinearity plays an essential role Fortunately the geometric theory of non linear control system analysis progressed substantially during the 1980s and 90s providing crucial conceptual tools that addressed many of our needs However as any control systems engineer can attest issues of modeling computation and implementation quickly become the dominant concerns in practice The problems of interest to us present unique challenges because of the need to build and manipulate complex mathematical models for both the plant and controller As a result along with colleagues and students we set out to develop computer algebra tools to facilitate model building nonlinear control system design and code generation the latter for both numerical simulation and real time control implementation This book is a result the unique features of the book includes an integrated treatment of nonlinear control and analytical mechanics and a set of symbolic computing software tools for modeling and control system design By simultaneously considering both mechanics and control we achieve a fuller appreciation of the underlying geometric ideas and constructions that are common to both Control theory has had a fruitful association with analytical mechanics from its birth in the late 19th century

Computational Science — ICCS 2002 Peter M.A. Sloot, C.J. Kenneth Tan, Jack J. Dongarra, Alfons G. Hoekstra, 2003-08-01 Computational Science is the scientific discipline that aims at the development and understanding of new computational methods and techniques to model and simulate complex systems The area of application includes natural systems such as biology environmental and geosciences physics and chemistry and synthetic systems such as electronics and financial and economic systems The discipline is a bridge between classical computer science logic complexity architecture algorithms mathematics and the use of computers in the aforementioned areas The relevance for society stems from the numerous challenges that exist in the various science and engineering disciplines which can be tackled by advances made in this field For instance new models and methods to study environmental issues like the quality of air water and soil and weather and climate predictions through simulations as well as the simulation supported development of cars airplanes and medical and transport systems etc Paraphrasing R Kenway R D Kenway Contemporary Physics 1994 There is an important message to scientists politicians and industrialists in the future science the best industrial design and manufacture the greatest medical progress and the most accurate environmental monitoring and forecasting will be done by countries that most rapidly exploit the full potential of computational science Nowadays we have access to high end computer architectures and a large range of computing environments mainly as a consequence of the enormous stimulus from the various international programs on advanced computing e.g. *Applied*
