professionals researchers practitioners and medical chemists actively involved in computational chemistry and pharmaceutical sciences Handbook for Applied Modeling: Non-Gaussian and Correlated Data Jamie D. Riggs, Trent L. Lalonde, 2017-07-14 Designed for the applied practitioner this book is a compact entry level guide to modeling and analyzing non Gaussian and correlated data Many practitioners work with data that fail the assumptions of the common linear regression models necessitating more advanced modeling techniques This Handbook presents clearly explained modeling options for such situations along with extensive example data analyses The book explains core models such as logistic regression count regression longitudinal regression survival analysis and structural equation modelling without relying on mathematical derivations All data analyses are performed on real and publicly available data sets which are revisited multiple times to show differing results using various modeling options Common pitfalls data issues and interpretation of model results are also addressed Programs in both R and SAS are made available for all results presented in the text so that readers can emulate and adapt analyses for their own data analysis needs Data R and SAS scripts can be found online at <http://www.spesi.org> **Introduction to Applied Bayesian Statistics and Estimation for Social Scientists** Scott M.

Lynch, 2007-06-30 Introduction to Applied Bayesian Statistics and Estimation for Social Scientists covers the complete process of Bayesian statistical analysis in great detail from the development of a model through the process of making statistical inference The key feature of this book is that it covers models that are most commonly used in social science research including the linear regression model generalized linear models hierarchical models and multivariate regression models and it thoroughly develops each real data example in painstaking detail The first part of the book provides a detailed introduction to mathematical statistics and the Bayesian approach to statistics as well as a thorough explanation of the rationale for using simulation methods to construct summaries of posterior distributions Markov chain Monte Carlo MCMC methods including the Gibbs sampler and the Metropolis Hastings algorithm are then introduced as general methods for simulating samples from distributions Extensive discussion of programming MCMC algorithms monitoring their performance and improving them is provided before turning to the larger examples involving real social science models and data
