Global Supply Chain Performance and Risk Optimization Rob Smith, 2012-12-06 This doctoral dissertation deals with a very timely and important topic in the fields of international operations finance and risk management namely the evaluation of the Real Option value of operational and managerial flexibility within a global supply chain network The author who has worked for more than nine years on international supply chain strategy and design as an executive in world class automotive and high tech companies in the U S and in Europe uses a large scale data set from an existing global supply chain operated by a tier one supplier in the global automotive industry in examining and comparing the following supply chain strategies single sourcing dual sourcing compliance with local content rules centers of excellence and Real Options with flexibility in sourcing production and distribution logistics The major finding of this empirical study is the identification of a Real Options strategy that results in a positive payback in less than a year and dominates all of the other supply chain strategies The three main contributions of this work are i for the first time a comprehensive and real data set is utilized to quantify and demonstrate the financial performance of various supply chain design strategies ii a new model of real price changes i e

Solutions Sucar, L. Enrique, Morales, Eduardo F., Hoey, Jesse, 2011-10-31 One of the goals of artificial intelligence AI is creating autonomous agents that must make decisions based on uncertain and incomplete information The goal is to design rational agents that must take the best action given the information available and their goals Decision Theory Models for Applications in Artificial Intelligence Concepts and Solutions provides an introduction to different types of decision theory techniques including MDPs POMDPs Influence Diagrams and Reinforcement Learning and illustrates their application in artificial intelligence This book provides insights into the advantages and challenges of using decision theory models for developing intelligent systems

Complementarity Modeling in Energy Markets Steven A. Gabriel, Antonio J. Conejo, J. David Fuller, Benjamin F. Hobbs, Carlos Ruiz, 2012-07-20 This addition to the ISOR series introduces complementarity models in a straightforward and approachable manner and uses them to carry out an in depth analysis of energy markets including formulation issues and solution techniques In a nutshell complementarity models generalize a optimization problems via their Karush Kuhn Tucker conditions b on cooperative games in which each player may be solving a separate but related optimization problem with potentially overall system constraints e g market clearing conditions c onomic and engineering problems that aren t specifically derived from optimization problems e g spatial price equilibria d roblems in which both primal and dual variables prices appear in the original formulation e g The National Energy Modeling System NEMS or its precursor PIES As such complementarity models are a very general and flexible modeling format A natural question is why concentrate on energy markets for this complementarity approach s it turns out energy or other markets that have game theoretic aspects are best modeled by complementarity problems The reason is that the traditional perfect competition approach no longer applies due to deregulation and restructuring of these markets and thus the corresponding optimization problems may no longer hold Also in some instances it is important in the original model formulation to involve both primal variables e g production as well as dual variables e g market prices for public and private sector energy planning Traditional optimization problems can not directly handle this mixing of primal and dual variables but complementarity models can and this makes them all that more effective for decision makers
