

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a groove which distributes seal stress in a groove with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage throughout the life cycle application. The gasket compresses to the combustion chamber to prevent the cooling surfaces from the cylinder. This is done by creating a seal between the gasket and the combustion chamber. The gasket is used to prevent leakage of the combustion chamber from the cooling surfaces. If the gasket is not installed correctly, the gasket will be damaged and the cylinder will be damaged.

In order to determine the application requirements, the gasket designer is required to determine the gasket requirements in advance. Every gasket application is unique and every application requires that the gasket be selected to meet the requirements of the application.
