**Machine Learning Experimentation with TensorBoard** IMRAN US SALAM. MIAN,2021-10 Applications of Machine Learning in Test Cost Reduction and Quality Improvement Konstantinos Xanthopoulos,2019 The production of Integrated Circuits ICs is one of the most intricate processes currently performed in the world on such a large scale Due to this complexity process variations that are present in any manufacturing field are intensified resulting in compromising the main production goals performance reliability and low cost To combat the effects of process variations multiple control steps have been introduced in the process at all stages to test filter or re calibrate the material produced Despite considerable efforts to simultaneously attain all three goals of manufacturing such solutions have not yet been established Instead depending on the product goals only two of the goals are targeted consequently compromising the third In this work we aim to study solutions where performance reliability and low cost can be reached simultaneously To achieve this we plan to utilize the plethora of data produced in all stages of the manufacturing process and at many granularity levels allowing us to design adaptive machine learning based solutions that counter the effects process variation has in the end result Several studies will be presented focusing on cost reduction for testing which constitutes one of the major cost bloating factors and on improving the quality of tests performed Each study is based on data provided by our industrial collaborators thus supporting the practicality of the proposed solutions *Learning Linear Programs* Yingcong Tan,2021 Conventionally in an optimization problem we aim to determine the values of the decision variables to minimize the objective function subject to the constraints We refer to this problem as the forward optimization problem FOP In an inverse optimization IO problem the goal is to determine the coefficients of an FOP such that an observed solution becomes an optimal solution of the learned FOP model In this dissertation we focus on the inverse linear optimization problem whose FOP has the form of linear programming We adopt an interdisciplinary approach leveraging concepts and methods from machine learning to address a very general form of this problem Firstly we study the general form of the inverse linear optimization problem that is

learning all model coefficients individually or jointly where the unknown model coefficients may or may not depend on exogenous parameters We are the first to cast the IO problem as a form of deep learning and solve it with a gradient based algorithm To compute the gradients we differentiate through the steps of an optimization process in particular the Barrier interior point method We develop new sets of benchmark instances and show good performance of our algorithm on different IO tasks 1 learning a cost vector of linear program 2 learning cost vector and constraints of a linear program jointly 3 learning unknown parameters in the objective and constraints of a parametric linear program To the best of our knowledge this algorithm is the first IO approach in the literature to be able to handle all three types of tasks Secondly we formulate the inverse linear optimization problem as a bilevel optimization problem and explicitly encode constraints in the outer problem to ensure that observed solutions remain feasible with respect to the constraints Again by leveraging a machine learning perspective on inverse linear optimization we develop a general purpose framework to solve the bilevel model with gradient based algorithms We investigate different methods for differentiating through an optimization problem and specialize them to LP Additionally we focus on an objective based loss function and derive a closed form expression for computing gradients Experimental results show that our framework is capable of solving synthetic parametric linear program and multi commodity flow problem instances which could not be previously solved by methods in the IO literature Additionally we show that our closed form expression is orders of magnitude faster than other methods for computing the gradients Finally we focus on a special case of learning the objective only We present four different methods for solving this problem including three mathematical formulations and one general gradient based algorithm We test all four methods on synthetic parametric linear program and multi commodity flow problem instances and show that all four methods can successfully solve all experimental instances All three mathematical models are solved in a commercial optimization solver and due to their specialized nature outperform the more generic gradient based algorithm in runtime Additionally we show that the parametric linear programs learned from the KKT based and strong duality based formulations produce the best predictions on testing data In summary the main contribution of this dissertation is the development of a general gradient based framework which is able to solve problems that were previously not tackled in the IO literature In addition we extend and unify models for the special case of learning the objective only which has been the focus of previous IO work This dissertation unifies machine learning and inverse optimization both at the modelling and algorithmic levels
