passage a challenging and fun project that offers insight into many different aspects of computer science some deeply theoretical and others highly practical This book offers a one semester introduction into compiler construction enabling the reader to build a simple compiler that accepts a C like language and translates it into working X86 or ARM assembly language It is most suitable for undergraduate students who have some experience programming in C and have taken courses in data structures and computer architecture **Introduction to Compiler Construction** Thomas W. implementing a translator for a programming language A simple high level language loosely based on C is used to illustrate aspects of the compilation process Code examples in C are included together with discussion and illustration of how this code can be extended to cover the compilation of more complex languages Examples are also given of the use of the flex and bison compiler construction tools Lexical and syntax analysis is covered in detail together with a comprehensive coverage of semantic analysis intermediate representations optimisation and code generation Introductory material on parallelisation is also included Designed for personal study as well as for use in introductory undergraduate and postgraduate courses in compiler design the author assumes that readers have a reasonable competence in programming in any high level language
