An Introduction to Digital Communications Jack Kurzweil,2000 The only book available that integrates a realistic design approach with a theoretical approach This outstanding new book focuses on the central theoretical and practical issues involved in modem design The first half deals with the basic issues of base band and passband data transmission and contains descriptions of applications to specific digital transmission systems The second half specifically addresses design issues including timing and carrier recovery channel characterization adaptive equalization and trellis coding The author uses simulation programs in Matlab and C to help readers Determine the power spectral density of complex data encoding rules Simulate the performance of passband data transmission techniques Design and assess the performance of carrier recovery systems Develop time domain models for a variety of channels Design and assess the performance of adaptive equalizers Use existing programs as the framework for creating simulation modules

Theory and Design of Adaptive Filters John R. Treichler,C. Richard Johnson,Michael G. Larimore,2001 Rather than superficially examining an extensive list of possible applications benefiting from adaptive filter use the authors examine four such problems in detail and review the common attributes that are shared with many other applications of adaptive filtering The authors develop the basic rules and algorithms for filter performance and provide tools for design along with an appreciation of the complexity of behavioral analysis Derivations and convergence discussions are kept to a basic level The presentation focuses on a few principles and applies them to a series of motivating examples that include in depth discussion of implementation aspects for filter design not found in other books Serves as a valuable reference for practicing engineers
