

## Establishing a central leader apple tree

The standard central leader tree training system is ideal for medium density plantings of semi-dwarf apples. This system establishes two or three tiers of permanent scaffolds rather than the temporary scaffolds utilized in the French axe or slender spindle tree.

### To establish central leader trees:

**FIRST YEAR:** Head at planting time to 30" to encourage development of the first tier of scaffold branches at a height of 20-30". If wide angle branches are available at planting time, select four and tip lightly. Remove the rest, if all existing branches are undesirable, remove them, leaving 1/4" stub, so as not to damage latent buds at base of branch. In early summer, widen crotch angles of potential scaffolds by spreading with clothespins when shoots are 3-4" long.

**SECOND YEAR:** Complete first tier as stated for first year tree. Remove all unwanted, poorly positioned or narrow angled branches. If central leader has obtained enough height, tip 36-42" above first tier to encourage second tier of 4 wide angled branches at 30-36" above first tier. Tip central leader and scaffolds to stiffen and encourage branching. Limb spreading to 45° off vertical should begin at this point.

**THIRD YEAR:** Remove all unwanted branches from central leader and treat established scaffolds similarly to the leader (single up forks, remove uprights, and tip) to develop more horizontal wood. If possible, tip to promote third tier 30-36" above second tier. Continue spreading as necessary.

**FOURTH YEAR:** Complete second and third tier as stated for 3 year tree if necessary. Central leader will eventually be headed severely, probably into 2 year wood, to bring it into balance with the rest of the tree. As trees fill space allotted and approach bearing age, make fewer heading cuts and more thinning cuts. Shorten limbs reaching into drive aisles or other trees by thinning back to less vigorous side branches. Maintain central leader and pyramidal form on into maturity. Never allow an upper tier to shade out or outgrow lower limbs.

## Establishing an open vase peach tree

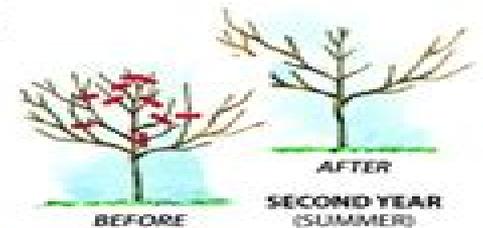

Open center or vase is the most common method of pruning peach and nectarine trees. Peaches will not produce fruit buds in shade, so a very open pruning system is required for best light and air circulation. In addition, most peach varieties are naturally spreading in their growth habit.

**FIRST YEAR (SUMMER):** Head at planting time to 30" and "whip" the tree by removing all branches to a 1/4" stub, so as not to damage latent buds. Early in the first growing season, strip lower shoots, leaving the top six to eight shoots. The top three to four shoots, near heading cut, will be upright and should be summer tipped by removing half the growth. This will encourage lower branches to form wider angles.

**SECOND YEAR (DORMANT):** Tip upper branches again to retain "bush" in top center of the tree and promote spreading of scaffolds. Choose two or three scaffolds avoiding branches headed into the southwest. Only tip scaffolds which are too dominant.

**SECOND YEAR (SUMMER):** Tip again on "bush" to promote vigor in selected scaffold limbs. Severely tip any upright growth which initiates within 15" of the trunk to promote vigorous extension of the scaffolds. Summer pruning during the first and second years may be required more than once.

**THIRD YEAR (DORMANT):** Remove "bush" from upper center of the tree. Remove uprights from main scaffold and "single up" any forks. Make heading cuts as required to prevent dominant scaffolds. Continue thinning and remove vigorous uprights as tree matures. Encourage renewal of first year's fruiting wood by tipping to an outward growing lateral.

**The Fruit Tree Pruning Guide** Dr Rita Brooks, 2022-08-27 PRUNING MADE EASY If you have fruit trees you want them to be productive and vigorous so that you ll get lots of spring flowers and summer fruit This means you ll have to prune them regularly and correctly Not sure when or how to prune your fruit trees Pruning corrects the natural tendencies of fruit trees that may counterproductive to growing fruit or undesirable The natural tendency to grow too many shoots and large branches ultimately causes shading in the interior canopy and lower branches This lack of sunlight inhibits flowering and weakens branches Trees with an open well lit canopy grow larger fruit compared to trees that grow into a thicket Because they are trees they can grow to tall heights which creates difficulty in harvesting Branches that grow beyond a height or length that is desired can be shortened or removed by pruning Trees can be pruned to have a certain shape that is designed to be more fruitful or to be visually pleasing within the landscape Pruning is the standard way to remove dead and dying branches To partly correct the tendency of apple trees to bear fruit in alternate years can be partly corrected with pruning There are many reasons for pruning fruit trees Why prune fruit trees at all Unpruned trees especially young ones will grow branches galore and push out blooms each year These in turn will become fruit The more each bloom has to compete the smaller the fruit will be Too many blooms and fruits competing for nutrition from the tree can be a burden and eventually cause damage to the tree The best time to prune fruit trees is late winter into early spring when it will least affect winter hardiness and tree health Summer pruning in late July or August is another time when pruning can be performed but severe pruning at this time will weaken the tree Therefore the majority of pruning should be done during winter or spring Pruning lessens winter hardiness to a small degree so pruning in early winter can lead to winter injury when it is followed by severely cold temperatures It takes two weeks for the tree to regain winter hardiness that is lost due to pruning Ready to discover more Grab a copy of this book now
