Parallel Programming Thomas Rauber, Gudula R Nger, 2010-03-10 Innovations in hardware architecture like hyper threading or multicore processors mean that parallel computing resources are available for inexpensive desktop computers In only a few years many standard software products will be based on concepts of parallel programming implemented on such hardware and the range of applications will be much broader than that of scientific computing up to now the main application area for parallel computing Rauber and R nger take up these recent developments in processor architecture by giving detailed descriptions of parallel programming techniques that are necessary for developing efficient programs for multicore processors as well as for parallel cluster systems and supercomputers Their book is structured in three main parts covering all areas of parallel computing the architecture of parallel systems parallel programming models and environments and the implementation of efficient application algorithms The emphasis lies on parallel programming techniques needed for different architectures The main goal of the book is to present parallel programming techniques that can be used in many situations for many application areas and which enable the reader to develop correct and efficient parallel programs Many examples and exercises are provided to show how to apply the techniques The book can be used as both a textbook for students and a reference book for professionals The presented material has been used for courses in parallel programming at different universities for many years

Numerical Analysis Timothy Sauer, 2025-10-21 The most readable and relevant numerical analysis text is now infused with web links at point of use Numerical Analysis 3rd Edition is written for students of engineering science mathematics and computer science who have completed elementary calculus and matrix algebra The book covers both standard topics and some of the more advanced numerical methods used by computational scientists and engineers while maintaining a level appropriate for undergraduates Students learn to construct and explore algorithms for solving science and engineering problems while situating these algorithms in a landscape of some potent and far reaching principles Specifically the author cultivates a grasp of the fundamental concepts that permeate numerical analysis including convergence complexity conditioning compression orthogonality and its competing concerns of accuracy and efficiency MATLAB software is used both for exposition of algorithms and as a suggested platform for student assignments and projects The 3rd Edition is web enhanced with over 200 short URLs that take students beyond the book to useful digital resources created to support their use of the text

Forthcoming Books Rose Army, 2000 *Object Recognition* M. Bennamoun, G.J. Mamic, 2012-12-06 Automatic object recognition is a multidisciplinary research area using concepts and tools from mathematics, computing, optics, psychology, pattern recognition, artificial intelligence, and various other disciplines. The purpose of this research is to provide a set of coherent paradigms and algorithms for the purpose of designing systems that will ultimately emulate the functions performed by the Human Visual System (HVS). Hence, such systems should have the ability to recognise objects in two or three dimensions independently of their positions, orientations, or scales in the image. The HVS is employed for tens of thousands of recognition events each day, ranging from navigation through the recognition of landmarks or signs, right through to communication through the recognition of characters or people themselves. Hence, the motivations behind the construction of recognition systems which have the ability to function in the real world is unquestionable and would serve industrial, e.g. quality control, military, e.g. automatic target recognition, and community needs, e.g. aiding the visually impaired.

Scope and Organisation of this Book This book provides a comprehensive yet readable foundation to the field of object recognition from which research may be initiated or guided. It represents the culmination of research topics that I have either covered personally or in conjunction with my PhD students. These areas include image acquisition, 3D object reconstruction, object modelling, and the matching of objects, all of which are essential in the construction of an object recognition system.

Updated throughout to address new research on themes including haptics, autonomous vehicles, and circadian rhythms. Includes discussions of the physical, anthropometric, biomechanical, and mental capacities of the human, along with tables of reference data. Provides both managerial and engineering recommendations covering aspects of ergonomics that are relevant across the project.
