## Student Exploration: Human Evolution - Skull Analysis

### Prior Knowledge Questions

- Label one of the **skulls** below as human and the other as a chimpanzee skull.

Human

Chimpanzee

- What features did you use to identify which skull was human and which was chimpanzee?

The shape of the **cranial cavity** and jaw, as well as the front of the mouth. Also because of the shape of the teeth and placement of **tooth sockets**, and **jaw line**.

In 1924, a fossilized skull that looked very similar to a chimp skull was discovered. But the skull most definitely did not belong to a chimp. The location of the **foramen magnum**—a hole in the skull where the spinal cord exits—indicated that the individual was **bipedal**, or walked on two legs. This fossil was some of the earliest evidence of human evolution.

- Examine the **front** view of the **homo sapiens** (modern human) skull. Examine the same view of the **Pan troglodytes** (chimp) skull.

How do the skulls compare?

The chimp skull is more elongated. Also the teeth are spaced very differently.

Now, examine the **bottom** view of the two skulls. How do they compare?

**Interpretation:** Skulls, even from the same species, use many a wide variety of shapes and sizes. To compare skulls, scientists use measurements of certain features to calculate indices. An **index** is a ratio of one measurement to another.

An important index for measuring hominid skulls is the **orbital index**. This index indicates the position of the **foramen magnum** in the base of the **skull**. The orbital index can indicate whether a hominid species was bipedal or not.

**Question:** How does the location of the foramen magnum indicate if a species was bipedal?

- Measure:** Examine the **bottom** view. To determine the orbital index for humans and chimps, follow the steps below and complete the table.
