Rotating Fields In General Relativity:

Rotating Fields in General Relativity Jamal Nazrul Islam, 2009-06-18 The aim of this book is to introduce the reader to research work on a particular aspect of rotating fields in general relativity The account begins with a short introduction to the relevant aspects of general relativity written at a level accessible to a beginning graduate student in theoretical physics There follows a detailed derivation of the Wehl Lewis Papapetrou form of the stationary axially symmetric metric The Kerr and Tomimatsu Sato forms of the rotating interior and exterior solutions of the Einstein equations are then discussed The last three chapters of the book illustrate the applications of the theory to rotating neutral dust rotating Einstein Maxwell fields and rotating charged dust The author has drawn on his own research work to produce a timely discussion of this important area of research

The Rotating Fields in General Relativity Shohel Ahmed, 2019-05-16 The black holes of nature are the most perfect macroscopic objects there are in the universe the only elements in there that constructed our concept of space and time Black holes are a class of gravitational objects predicted by Einstein s theory of general relativity given by him in 1915 And since the general theory of relativity provides only a single unique family of solutions for their descriptions they are the simplest objects as well Due to the gravitational effects on space time its most striking property is that there is a region of space around a black hole where light is unable to escape The unique two parameter family of solutions which describes the space time around black hole is the Kerr family discovered by Roy Patrick Kerr in July 1963 The two parameters are the mass and the angular momentum of the black holes The static solution with zero angular momentum was discovered by Karl Schwarzschild in December 1915 A study of the black holes of nature is then a study of these solutions It is to this study that this book is devoted

Relativistic Geodesy Dirk Puetzfeld, Claus Lämmerzahl, 2019-02-09 Due to steadily improving experimental accuracy relativistic concepts based on Einstein s theory of Special and General Relativity are playing an increasingly important role in modern geodesy This book offers an introduction to the emerging field of relativistic geodesy and covers topics ranging from the description of clocks and test bodies to time and frequency measurements to current and future observations Emphasis is placed on geodetically relevant definitions and fundamental methods in the context of Einstein s theory e g the role of observers use of clocks definition of reference systems and the geoid use of relativistic approximation schemes Further the applications discussed range from chronometric and gradiometric determinations of the gravitational field to the latest satellite experiments The impact of choices made at a fundamental theoretical level on the interpretation of measurements and the planning of future experiments is also highlighted Providing an up to the minute status report on the respective topics discussed the book will not only benefit experts but will also serve as a guide for students with a background in either geodesy or gravitational physics who are interested in entering and exploring this emerging field

the other three fundamental fields electromagnetism the weak and strong fields As described for the first time in this book unification is achieved straightforwardly with the principles of standard Cartan geometry and the Evans Ansatz The latter shows that electromagnetism is spinning spacetime gravitation is curving spacetime and that they are unified with the structure or master equations of Cartan Quantum mechanics is unified with general relativity using the Evans Lemma and wave equation Technical appendices and charts are provided which show how all the major equations of physics are obtained from the ECE field theory and two introductory chapters describe the background mathematics from an elementary level In this third volume ECE theory is extended to the Sagnac effect and Faraday disc generator to show that electrodynamics is spinning space time in general relativity These two effects are difficult to explain with special relativity A simplified dielectric ECE theory is developed and applied for example to cosmology One chapter is dedicated to a convenient summary of all the details of Cartan geometry needed to develop ECE theory The important topic of spin connection resonance SCR is introduced and applied to new energy and counter gravitation Finally wave mechanics is developed in ECE
