Computer and Information Technology Prasad Yarlagadda,Seung Bok Choi,Yun Hae Kim,2014-02-06 Selected peer reviewed papers from the International Forum on Computer and Information Technology IFCIT 2013 December 24 25 2013 Shenzhen China *Multipath TCP in Wireless Networks* Mijanur Rahaman Palash,2018 Multipath TCP MPTCP is a new modification of TCP protocol which enables a client to transfer data over multiple paths simultaneously under a single TCP connection for improved throughput and fault resilience However MPTCP is susceptible to some major drawbacks when applied in a wireless network We found several cases where despite improving individual MPTCP clients throughput MPTCP reduces the capacity of the overall wireless network due to the mac level fairness and contention based access schemes Additionally even if the bandwidth improves employing Multipath TCP MPTCP in wireless networks can be energy inefficient due to additional energy consumption by multiple interfaces This creates a dilemma between bandwidth improvement and energy efficiency This thesis research aims to solve these important issues for MPTCP in the wireless environment We analyzed the root cause of these drawbacks and identified instances where they can arise Two novel schemes denoted MPWiFi and kMPTCP are developed to solve the bandwidth degradation and energy efficiency issues respectively while maintaining the promised benefits of MPTCP The MPWiFi assigns different priorities to the subflows and aggressively suppresses some of them based on some design logic Similarly kMPTCP adds an additional multipath subflow only if the bandwidth requirement can t be fulfilled by single path and the new subflow meets the data rate and signal strength condition Moreover kMPTCP keeps additional subflows as long as the signal strength remains in good range and this subflow remain mandatory to provide the necessary bandwidth to the application These two schemes have been implemented along

with Linux Kernel MPTCP implementation Extensive real world deployment and NS3 simulation show that the proposed schemes can effectively alleviate the adverse impacts of the MPTCP based multipath access in wireless networks

Performance Improvement of Multipath TCP Over Non-uniform Paths Using Slow Path Adaptation Sabur Hassan Baidya,University of Texas at Dallas. Graduate Program in Computer Science,2013 This thesis describes a thorough evaluation of performance of recently developed Multipath Transport Protocol namely MPTCP deals with some performance issues in specific scenarios and proposes a potential solution Multipath TCP MPTCP is an extension of TCP developed by Internet Engineering Task Force IETF to support communication between source and destination through multiple flows under a single connection session We have conducted several experiments with real hardware on flows with extreme variation in path quality and found that unless receive buffer size is increased to a much higher value the overall throughput decreases below the level of single path TCP throughput We propose a Slow Path Adaptation SPA technique to overcome this issue without affecting other performance parameters The implementation is done on Linux kernel and experimental results are presented Efficient MPTCP-based Multipath Network Access for Connected Vehicles Imran Khan,2020 Providing reliable and resilient network services to vehicles under fast mobility is a challenging aspect of designing next generation wireless network systems Exploiting Multipath TCP MPTCP to enable vehicles to use multiple wireless connections simultaneously denoted multipath network access is a promising solution to this challenge However the current design of MPTCP makes it susceptible to some major drawbacks when applied directly to improve the network performance of connected vehicles Particularly the fast dynamism of the characteristics e g round trip time loss rate of wireless connections under vehicle mobility can significantly degrade the throughput This thesis aims to address the underlying reasons for such performance degradation and proposes a solution to overcome the challenges faced by connected vehicles We first analyze the reasons for the throughput degrading and verify them through in lab measurements We then model instances where MPTCP based multipath network access would perform worse than using the single path TCP over available wireless connections separately Based on the analysis we propose an efficient bandwidth aggregation scheme EBA that mitigates the performance drop of MPTCP under fast mobility scenarios by selectively duplicating packets over parallel access paths This scheme has been implemented in the Linux Kernel and tested extensively through simulated scenarios Experimental results reflect that EBA can effectively enhance the performance of MPTCP for connected vehicles *TCP/IP Architecture, Design, and Implementation in Linux* Sameer Seth,M. Ajaykumar Venkatesulu,2009-01-23 This book provides thorough knowledge of Linux TCP IP stack and kernel framework for its network stack including complete knowledge of design and implementation Starting with simple client server socket programs and progressing to complex design and implementation of TCP IP protocol in linux this book provides different aspects of socket programming and major TCP IP related algorithms In addition the text features netfilter hook framework a complete explanation of routing sub system IP QOS implementation and Network Soft
