21. Sample answer: One could use a computer model to investigate what would happen if an entire species were removed from an ecosystem. The computer model would have to account for all possible feeding relationships in the ecosystem and any other symbiotic relationships, such as a relationship in which an individual of one species provided shelter or protection to an individual of another species. Once the computer model accounted for all existing relationships and relative numbers of individuals of each species in the starting community, you could run a simulation in which the presumed keystone species were removed. If the result of the simulated removal caused several other populations to become extinct, one could conclude that the species removed was a keystone species.
22. D

### Think Critically—Suggested Answers

23. Sample answer: Both predator and prey populations may fluctuate because of competition with other species for resources. In addition, predators and prey can sometimes "regulate" one another. Too few prey can lead to a decrease in predator populations, and too many predators can lead to a decrease in prey populations.
24. Sample answer: Specialization to a narrow niche can be an advantage if it allows one species to exclusively use a specific food source or habitat, thereby reducing interspecific competition. If that resource disappeared, however, narrow specialization would be a disadvantage; the species would have no other resources to fall back on.
25. A broad niche will likely overlap with many other niches for food, habitat, and other resources. When niches overlap, competition occurs.
