The Parts of Lungs

The respiratory system is made up of

- Trachea
- Bronchi (Main)
- Bronchioles (Small)
- Alveoli (Tiny sacs where gas exchange happens)

Right and Left Lungs

Each lung has a main part called the **lobes**. The right lung has three lobes, and the left lung has two lobes.

The main part is made up of **lobules**. Each lobule is made up of **lobules**.

Diaphragm - A muscle that separates the chest from the abdomen.

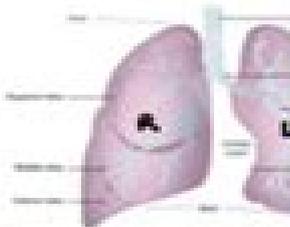

Air is inhaled or exhaled by moving the diaphragm up and down.

The Bronchial Tree

The bronchial tree is the system of airways that carries air from the trachea to the lungs.

- Trachea
- Primary bronchi
- Secondary bronchi
- Tertiary bronchi
- Bronchioles
- Terminal bronchioles
- Alveoli (where gas exchange happens)

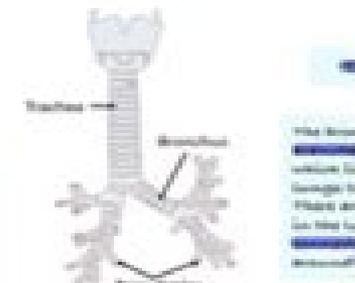

The Pleural Cavity

The pleural cavity is the space between the two lungs. It is filled with **pleural fluid**, which helps the lungs slide past each other as they expand and contract.

The Diaphragm

The diaphragm is a muscle that separates the chest from the abdomen. It contracts and relaxes to help with breathing.

A diagram showing the diaphragm.

The mechanics of respiration involve the contraction and relaxation of the diaphragm and the external intercostal muscles. This is dependent on the pressure changes in the thoracic cavity and the external atmosphere.

Inhalation

During normal breathing, the diaphragm contracts and the external intercostal muscles contract.

This causes the volume of the thoracic cavity to increase, and the pressure to decrease.

As a result, air is drawn into the lungs.

Exhalation is the opposite of inhalation. The diaphragm relaxes and the external intercostal muscles relax.

Inhalation - The process of breathing in. It involves the contraction of the diaphragm and the external intercostal muscles, which increases the volume of the thoracic cavity and decreases the pressure, causing air to be drawn in.

Exhalation - The process of breathing out. It involves the relaxation of the diaphragm and the external intercostal muscles, which decreases the volume of the thoracic cavity and increases the pressure, causing air to be forced out.

Diaphragm - A muscle that separates the chest from the abdomen. It contracts and relaxes to help with breathing.

External intercostal muscles - Muscles located between the ribs that contract and relax to help with breathing.

Pressure - The force exerted by air molecules. It is higher in the atmosphere than in the thoracic cavity during inhalation.

Volume - The amount of space that a substance occupies. It increases during inhalation and decreases during exhalation.

Trachea - The windpipe, which carries air from the lungs to the rest of the body.

Bronchi - The main airways that branch off from the trachea.

Bronchioles - The smaller airways that branch off from the bronchi.

Alveoli - The tiny sacs where gas exchange happens.
