

Chapter 4 Tissues

A **tissue** is a group of cells with similar structure and function, plus the extracellular substance surrounding them.

Histology is the study of tissues.

Types of Tissues

There are four tissue types in the human body:

1. **Epithelial** – a covering or lining tissue
2. **Connective** – a diverse primary tissue type that makes up part of every organ in the body
3. **Muscle** – a tissue that contracts or shortens, making movement possible
4. **Nervous** – responsible for coordinating and controlling many body activities

4.2 Epithelial Tissues

Epithelium, or epithelial tissue, covers and protects surfaces, both outside and inside the body.

Included under the classification of epithelial tissue are the *exocrine* and *endocrine glands*

Characteristics of Epithelial

1. Mostly composed of cells
2. Covers body surfaces
3. Distinct cell surfaces
4. Cell and matrix connections
5. Nonvascular
6. Capable of regeneration

Functions of Epithelial Tissues

1. Protects underlying structures
2. Acts as a barrier
3. Permits passage of substances
4. Secretes substances
5. Absorption of substances

Classification of Epithelia

Epithelial tissues are classified primarily according to the number of cell layers and the shape of the superficial cells.

Simple	Stratified	Pseudostratified
epithelium consists of a single layer of cells, with each cell extending from the basement membrane to the free surface	epithelium consists of more than one layer of cells, but only the basal layer attaches the deepest layer to the basement membrane	columnar epithelium is a special type of simple epithelium, that appears to be falsely stratified. one layer of cells, with all the cells attached to the basement membrane

Due to variations in the shape of the cells, the epithelia appears stratified.

There are three types of epithelium based on idealized shapes of the epithelial cells:

1. **Squamous** cells are flat or scalelike.
2. **Cuboidal** cells are cube-shaped—about as wide as they are tall.
3. **Columnar** cells tend to be taller than they are wide.

Simple squamous epithelium is a single layer of thin, flat cells.	Some substances easily pass through this thin layer of cells, but other substances do not.	The lungs, simple squamous epithelium, allows for gas exchange. The kidneys, simple squamous epithelium, helps filter wastes from the blood while keeping blood cells inside the blood vessels
--	--	---

Simple cuboidal epithelium is a single layer of cube-like cells that carry	They have a greater secretory capacity than simple squamous epithelial
---	--
