

Discovering and Proving Circle Properties

Content Summary

In Chapter 6, students continue to build their understanding of geometry as they explore properties of circles. Some of these properties are associated with line segments related to circles; other properties are associated with arcs and angles. A circle is defined as a set of points equidistant from a fixed point, its center.

Line Segments Related to Circles

The best-known line segments related to a circle are its radius and diameter. Actually, the word *radius* can refer either to a line segment between a point on the circle and the center, or to the length of such a line segment. Similarly, *diameter* means either a line segment that has endpoints on the circle and passes through the center, or the length of such a line segment.

The diameter is a special case because it is the longest *chord* of a circle; a chord is a line segment whose endpoints are on the circle. Another line segment associated with circles is a *tangent* segment, which touches the circle at just one point and lies on a *tangent line*, which also touches the circle at just one point and is perpendicular to the radius at this point. Students learned about these segments in Chapter 1, and Lesson 6.1 provides a quick review.

Arcs and Angles

A piece of the circle itself is an *arc*. If you join each endpoint of an arc to the center of the circle, you form the *central angle* that intercepts the arc. The size of the arc can be expressed in degrees—the number of degrees in the arc's central angle. This chapter explores several such relationships among arcs, angles, and segments. Students also write paragraph and flowchart proofs to confirm the universality of these relationships.

The size of the arc can also be expressed in length. The arc length is calculated by using the total circumference, or the distance around the circle. The number π is defined to be the circumference of any circle divided by that circle's diameter; or, the circumference is π times the diameter. For example, if an arc is $\frac{1}{4}$ of the complete circle, then its central angle measures $\frac{1}{4}$ of 360° , and its length is $\frac{1}{4}$ of the circle's circumference.

Summary Problem

Draw a diagram of a central angle intercepting a chord of a circle and its arc, as shown in the picture.

Move points *A*, *B*, and *C* to different locations to illustrate the ideas of the chapter.

Questions you might ask in your role as student to your student:

- What concepts are illustrated in the original drawing?
- How could you move each of the points *A*, *B*, and *C* to show an inscribed angle?
- How could you move each of the points *A*, *B*, and *C* to show tangent segments?
