Clark, Stephen Martin, 2018-03-27 Behavioral Neuroscience of Learning and Memory brings together the opinions and expertise of some of the world s foremost neuroscientists in the field of learning and memory research The volume provides a broad coverage of contemporary research and thinking in this field focusing both on well established topics such as the medial temporal lobe memory system as well as emerging areas of research such as the role of memory in decision making and the mechanisms of perceptual learning Key intersecting themes include the molecular and cellular mechanisms of memory formation the multiplicity of memory systems in the brain and the way in which technological innovation is driving discovery Unusually for a volume of this kind this volume brings together research from both humans and animals often relatively separate areas of discourse to give a more comprehensive and integrated view of the field The book will be of interest to both established researchers who wish to broaden their knowledge of topics outside of their specific areas of expertise and for students who need a resource to help them make sense of the vast scientific literature on

this subject *Impact of Diet on Learning, Memory and Cognition* Amy Claire Reichelt, Margaret J. Morris, R. Fred Westbrook, 2017-08-22 Changes in food composition and availability have contributed to the dramatic increase in obesity over the past 30-40 years in developed and increasingly in developing countries. The modern diet now contains many foods that are rich in saturated fat and refined sugar. People who eat excessive amounts of this diet are not only likely to become overweight even obese, develop metabolic and cardiovascular diseases, some forms of cancer, but also undergo a more rapid rate of normal age-related cognitive decline and more rapid progression of neurological diseases such as dementia. A central problem is why people persist in consuming this diet in spite of its adverse health effects and when alternative food choices are available. As high fat, high sugar foods are inherently rewarding, eating for pleasure like taking psychoactive drugs can modulate reward neurocircuitry, causing changes in responsiveness to reward, predicting stimuli, and incentive motivation. Indeed, the excessive ingestion in modern societies and the resulting obesity epidemic may be viewed as a form of food addiction. Thus, a diet high in palatable foods is proposed to impact upon reward systems in the brain, modulating appetitive learning and altering reward thresholds. Impairments in other forms of cognition have been associated with obesity, and these have a rapid onset. The hippocampus appears to be particularly vulnerable to the detrimental effects of high fat and high sugar diets. Recent research has shown that as little as one week of exposure to a high fat, high sugar diet leads to impairments in place but not object recognition memory in the rat. Excess sugar alone had similar effects, and the detrimental effects of diet consumption were linked to increased inflammatory markers in the hippocampus, a critical region involved in memory. Furthermore, obesity-related inflammatory changes have also been described in the human brain that may lead to memory impairments. These memory deficits may contribute to pathological eating behaviour through changes in the amount consumed and timing of eating. The aim of this eBook is to present up-to-date information about the impact of diet and diet-induced obesity on reward-driven learning, memory, and cognition, encompassing both animal and human literature, and also potential therapeutic targets to attenuate such deficits.

Learning and Memory Marilee Sprenger, 1999 Brain research is much in the news, but what is its relevance in the classroom? Are there ways to take what brain researchers are discovering about learning and memory and apply it to the situations that educators face every day? Practicing teacher and author Marilee Sprenger tells how to do just that. In this book, Sprenger has spent years studying neurological research and training other educators in brain-compatible teaching methods. This background, combined with her long career as a classroom teacher, has given her priceless knowledge of what works in a multitude of classroom situations. Current brain research is as amazing as it can be confusing. This book discusses in plain terms the structure, function, and development of the human brain. The author describes the five memory lanes: semantic, episodic, procedural, automatic, and emotional, and tells how they function in learning and memory. She offers dozens of practical suggestions for teaching and assessing in brain-compatible ways. Bridging the gap between theory and practice, the book offers valid, usable. What you can do on Monday ideas to incorporate

into the classroom This is an approach to brain research that educators at all levels can apply in their daily work

Chemosensory Learning and Memory Milagros Gallo, Edmund Rolls, The contribution of research in the chemosensory field to advancing knowledge on learning and memory mechanisms has a long tradition At the middle of the twentieth century behavioural data provided evidence that taste and olfactory cues led to robust long lasting memories after single learning episodes The peculiar features of some of these types of learning such as conditioned taste aversion in mammals were a challenge for learning theory at the time which was modified in order to integrate the new findings In the following decades the reliability of the behavioural models favoured the application of anatomical neurophysiological and pharmacological techniques prompting great progress in the identification of the specific neural circuits involved in taste and olfactory learning thanks to the use of a variety of invertebrate and vertebrate models In spite of the previous views that considered chemosensory learning as simple models of learning based on its phylogenetic and ontogenetic universality at present the systems level approach is revealing the need to focus on the interactions between a variety of sensory rewarding cognitive emotional and motor systems for a full understanding The great impact on the field of the more recent developments in molecular biology and human neuroimaging techniques are also remarkable Nowadays understanding the brain processes involved in learning and memory requires a wider approach to the experience dependent neural plasticity that includes new phenomena such as adult neurogenesis and epigenetics In fact research on plasticity in the olfactory system is important in both areas Moreover the realms of chemosensory learning and memory have expanded to shed light on social clinical and applied issues thus creating a wide multidisciplinary scene In this context this Research Topic is aimed to offer an updated scene of the present knowledge and questions raised in a rapidly expanding field by gathering views obtained with different species from invertebrate to humans and various techniques Learning and Memory: From Brain to Behavior (International Edition) Mark A. Gluck, Eduardo Mercado, Catherine Myers, 2013-01-07 Developments in neuroscience have changed the field of learning and memory significantly in the last ten years This comprehensive introduction to learning and memory covers behavioural processes brain systems and clinical perspectives **Memory: Organization and Locus of Change** Larry R. Squire, Norman M. Weinberger, Gary Lynch, James L. McGaugh, 1992-03-19 This book brings together an internationally respected group of researchers for the purpose of examining neuroplasticity a topic of immense current interest in psychology neuroscience neuropsychology and clinical neurology The chapters represent state of the art work on neuroplasticity at all levels behavioral neural and molecular They describe recent work on memory ranging from cellular morphological studies in invertebrates to research on the human brain made possible by new advances in neuroimaging technology The book begins with an introductory chapter that considers the psychology of memory at the global structural level The remainder of the volume is divided into three related parts The first focuses on recent approaches which are based in part on new technology that aim to measure and describe activity in relatively large populations of

neurons The second focuses on memory at the level of brain systems One major theme to emerge from work at this level is that memory is composed of multiple separable components that can be identified with specific anatomical structures and connections The third part of the book focuses on molecular and cellular studies that show how individual neurons and their synapses behave in a history dependent manner This research concerns both brief changes in synaptic plasticity as well as more lasting changes in connectivity which depend on altered gene expression and morphological growth and change Altogether the chapters provide a rich summary of the breadth and excitement of contemporary research on the biology of memory

Implicit Memory Peter Graf, Michael E.J. Masson, 2013-12-02 The immense growth of research on implicit and explicit memory is making it difficult to keep up with new methods and findings to gauge the implications of new discoveries and to ferret out new directions in research and theory development The present volume provides a status report of work on implicit and explicit memory in the three areas that have contributed the bulk of what is known about this domain cognitive psychology lifespan developmental psychology and neuropsychology Highlighting developments in methods critical findings and theoretical positions this volume outlines promising new research directions By so doing it provides the reader with a multi disciplinary perspective on implicit and explicit memory and thereby enables a cross fertilization of ideas and research The chapters that make up this volume were written by experts on the topic of implicit and explicit memory These contributors were asked to write for a broad audience for their colleagues from allied disciplines for new researchers for advanced undergraduate and graduate students to help them gain a comprehensive overview of the mushrooming research on this topic grasp the most fundamental empirical and theoretical issues and focus on new research directions
