

GEOMETRY - Part 1

segments, lines, planes, geometric formulas

GEOMETRY HISTORY

Geometry means earth measurement. Early people used their basic knowledge of geometry to build roads, bridges, pyramids, and irrigation systems. The more formal study of geometry today is based on an interest in logical reasoning and mathematics, rather than in measurement alone. Euclid (c.300 B.C.), a legendary Greek geometer, was a brilliant volunteer set of books named **The Elements**, in which the geometric relationships were derived through deductive reasoning. Thus, the formal geometry studied today is often called **Euclidean geometry**. This geometry is also called **plane geometry** because the relationships deal with flat surfaces. Geometry has useful real terms, defined terms, postulates (statements that have not been proved, but have "worked" for thousands of years), and theorems (relationships that have been mathematically and logically proven).

GEOMETRIC FORMULAS

Perimeter: The perimeter, P , of a two-dimensional shape is the sum of all side lengths. Area: The area, A , of a two-dimensional shape is the number of square units that can be put in the shape enclosed by the sides. **Surface Area:** is the sum of the area combinations of multiplying lengths and widths, which always form 90° angles and will work except in circles. **Volume:** The volume, V , of a three-dimensional object is the number of cubic units that can be put in the object enclosed by all the sides.

Square Area:
 An $s \times s$ square has s^2 square units.
 An $s \times s$ square has s^2 square units.

DESCRIPTIONS OF UNDEFINED TERMS

Point
 A. A point may be described as a location with no length, no width, and no depth.
 B. A point is a letter named with a capital letter. It is usually located by writing a dot above the name of a point, although the name cannot really be drawn because they have no dimensions. (See Examples of Examples page 4)

Line
 A. A line may be described as a set of points going straight on forever in two opposite directions. Lines are straight and never end. They do not have a width or depth. They are usually drawn with arrows at both ends to show they go on forever in both directions. They are usually named by one of two ways. The first containing points K and N may be named by either:
 1. Using only the letters KN or NK after the name doesn't matter, the line indicator above the capital letters always points horizontally from left to right and never in any other direction. It is the usual direction of the points in space that determines the location and direction of the real line, not the direction of the line indicator above the capital letters on the number line.
 2. By using the letters \overleftrightarrow{KN} with a member subscript, for example, $\overleftrightarrow{KN}_1$ or $\overleftrightarrow{KN}_2$.

C. Two lines intersect at a point, and the intersection of lines can be described. See Algebra - Part 2.

Planes
 A. A plane may be described as a set of points going on forever in all directions except for one dimension that causes depth, meaning the very surface of a perfectly flat piece of paper extending on forever in every direction but having no thickness at all. This could be described as a structure such that when any two points in this plane are connected by a line, all points on the line are also in the plane. Planes have length and width, but no depth.
 B. Planes are usually referred to as "plane ABC " or "plane ABC (any 3 points on the plane that are not on the same line)" or "the plane containing \dots whatever points in the diagram". Planes cannot be drawn. Representations of planes are usually drawn as parallelograms, either with the arrows indicating that the plane goes on forever or without the arrows even though the points do go on forever.

Postulates
 Postulates are statements that have been used and accepted for centuries without formal proof. These are postulates:
 A. A line contains at least 2 points, and any 2 points locate exactly one line.

B. A plane contains at least 3 points that are not all on the same line, and any 3 points that are not on the same line locate exactly one plane. Therefore, a line and one point not on the line also locate exactly one plane.

C. Any 3 points locate at least one plane.

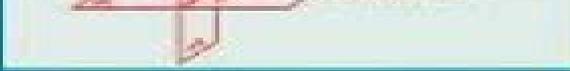

D. 3 or 2 points of a line are in a plane, and the line is in the plane, or, if two points are in a plane then the line containing the two points is also in the plane.

E. 3 or 2 planes intersect, and their intersection is a line.

F. Two planes intersect, and their intersection is a line.

DEFINED TERMS

There are many defined terms of plane geometry. The definitions of these terms will be given by name, group throughout the study guide rather than grouped by one big list.

Point: Postulates for several are relationships and statements that have worked for centuries and are accepted as true mathematically. These are relationships and statements that have been proved mathematically. Postulates and theorems are proved through logic and proof. They also are stated under the various levels of geometry. Sometimes they are called axioms or postulates or theorems, and sometimes they are simply stated and not labeled.

Space: refers to the set of all points. Space goes on forever in every direction, and has length, width, and depth. Space has no special restriction. It is simply defined as an space. Space contains at least 4 points that are not all on the same plane.

General Terms
 A. Two adjacent shapes are the same if adjacent side shares, after some movement of the shapes they can be made to fit exactly on top of each other.
 Note: Corresponding parts of adjacent polygons are adjacent, that is, one of the polygons have been moved around to match up perfectly, then the parts that match correspondingly are adjacent.
