

## TIMBER CONSTRUCTION

Chris Arnold, Building Systems Development, USA

### BACKGROUND

Wood construction is common for many single-family houses throughout the world. In areas where timber and wood materials are easily accessible, wood construction is often considered to be the cheapest and best approach for small housing structures.

Six main types of wood construction are listed in the encyclopedia. These types use all forms of timber available from logs to sawn/shaped timbers to smaller branches and leaves. These types also utilize various types of wall coverings from plant-based coverings to timber materials to earthen materials, such as mud or stone. The first type of wood construction is thatch construction, which is generally a traditional construction type. For examples of this type, see the traditional construction section of the encyclopedia. Other types include post-and-beam frame construction, walls with bamboo/reed mesh and post (wattle and daub), wooden frames with or without infill, and stud-wall frames with plywood/gypsum board sheathing. Two final types are wood panel construction and log construction.

Only some of the main types of wood construction are discussed in detail in the encyclopedia. The first of these construction types is stud-wall frame with plywood/gypsum board sheathing (Figure 1), which is popular worldwide and is the main type used in the United States (WHE Report 90), Canada (WHE Report 82), and Japan (WHE Report 86). For this type, walls are made of vertical timber elements of rectangular cross-section covered in light plywood or composite sheathing, with roofs made of timber members or prefabricated trusses, which are sheathed similar to the walls. The building foundations are usually concrete but sometimes are made of stone. In Japan, a post-and-beam frame is also constructed. It is similar to the stud-wall frame, except that it uses diagonal members to create its shear walls instead of sheathing. Horizontal timber construction (Figure 2) is found in parts of the Russian Federation, particularly in rural forested areas (WHE Report 56, Russian Federation). For this system, walls are made of horizontal sawn timber logs of square or circular cross-section joined without mechanical fasteners at the corners. The buildings have timber roofs and stone or concrete foundations. The final system of construction reviewed in the encyclopedia is wood panel construction (WHE Report 57, Russian Federation). This is typically found in the Russian Federation where its prefabricated panels are easily constructed for government low-income housing (Figure 3). Walls and floors are made of layered wood members with timber roofs and concrete foundations.

The study assesses the state of timber construction in the country and the potential for industrialized timber construction to help overcome the social housing deficit while revitalizing growth and lessening the construction sector's impact on climate change. This study has been prepared as a technical policy input aimed at supporting the Government's efforts to increase the construction of timber housing as a key pillar of its sustainable development and green reactivation agenda. The study consists of four chapters. Chapter one addresses the global construction crisis and the opportunity for Chile to lead the way in green construction using timber for social housing. Chapter two assesses the effects of regulatory frameworks on timber construction. Chapter three provides a financial analysis of timber construction in Chile, and chapter four analyzes barriers and opportunities for creating an action plan for timber housing. Each chapter includes an initial summary, a description of the methodology used for that chapter's analysis, and a concluding section which details the chapter's main findings.

Faced with man-made climate change and the need to provide housing for a growing world population, society needs to rethink the way future buildings are made. Wood is a truly renewable building material that is unlimited in supply if its growth and harvest are sustainably managed. Recent technological advancements in engineering allow the use of timber for the construction of multi-story structures, turning our buildings into carbon sinks rather than becoming sources for CO<sub>2</sub> emissions. The book presents convincing arguments for the increased use of wood as an alternative to more fossil fuel-intensive building materials with the goal of demonstrating that an integrated approach can have the potential for positive impact on the environment, local economies, and the building culture at large.      *General Technical Report FPL*, 1978
