Zaslavski,2021 This book is devoted to a detailed study of the subgradient projection method and its variants for convex optimization problems over the solution sets of common fixed point problems and convex

feasibility problems These optimization problems are investigated to determine good solutions obtained by different versions of the subgradient projection algorithm in the presence of sufficiently small computational errors The use of selected algorithms is highlighted including the Cimmino type subgradient the iterative subgradient and the dynamic string averaging subgradient All results presented are new Optimization problems where the underlying constraints are the solution sets of other problems frequently occur in applied mathematics The reader should not miss the section in Chapter 1 which considers some examples arising in the real world applications The problems discussed have an important impact in optimization theory as well The book will be useful for researches interested in the optimization theory and its applications **Convex Optimization & Euclidean Distance Geometry** Jon Dattorro,2005 The study of Euclidean distance matrices EDMs fundamentally asks what can be known geometrically given onlydistance information between points in Euclidean space Each point may represent simply locationor abstractly any entity expressible as a vector in finite dimensional Euclidean space The answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep Throughout we cite beacons of historical accomplishment The application of EDMs has already proven invaluable in discerning biological molecular conformation The emerging practice of localization in wireless sensor networks the global positioning system GPS and distance based pattern recognitionwill certainly simplify and benefit from this theory We study the pervasive convex Euclidean bodies and their various representations In particular we make convex polyhedra cones and dual cones more visceral through illustration andwe study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion We explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals The conic analogue to linear independence called conic independence is introducedas a new tool in the study of classical cone theory the logical next step in the progression linear affine conic Any convex optimization problem has geometric interpretation This is a powerful attraction the ability to visualize geometry of an optimization problem We provide tools to make visualization easier The concept of faces extreme points and extreme directions of convex Euclidean bodiesis explained here crucial to understanding convex optimization The convex cone of positive semidefinite matrices in particular is studied in depth We mathematically interpret for example its inverse image under affine transformation and we explainhow higher rank subsets of its boundary united with its interior are convex The Chapter on Geometry of convex functions observes analogies between convex sets and functions The set of all vector valued convex functions is a closed convex cone Included among the examples in this chapter we show how the real affinefunction relates to convex functions as the hyperplane relates to convex sets Here also pertinent results formultidimensional convex functions are presented that are largely ignored in the literature tricks and tips for determining their convexityand

discerning their geometry particularly with regard to matrix calculus which remains largely unsystematizedwhen compared with the traditional practice of ordinary calculus Consequently we collect some results of matrix differentiation in the appendices The Euclidean distance matrix EDM is studied its properties and relationship to both positive semidefinite and Gram matrices We relate the EDM to the four classical axioms of the Euclidean metric thereby observing the existence of an infinity of axioms of the Euclidean metric beyondthe triangle inequality We proceed byderiving the fifth Euclidean axiom and then explain why furthering this endeavoris inefficient because the ensuing criteria while describing polyhedra grow linearly in complexity and number Some geometrical problems solvable via EDMs EDM problems posed as convex optimization and methods of solution arepresented eg we generate a recognizable isotonic map of the United States usingonly comparative distance information no distance information only distance inequalities We offer a new proof of the classic Schoenberg criterion that determines whether a candidate matrix is an EDM Our proofrelies on fundamental geometry assuming any EDM must correspond to a list of points contained in some polyhedron possibly at its vertices and vice versa It is not widely known that the Schoenberg criterion implies nonnegativity of the EDM entries proved here We characterize the eigenvalues of an EDM matrix and then devisea polyhedral cone required for determining membership of a candidate matrix in Cayley Menger form to the convex cone of Euclidean distance matrices EDM cone ie a candidate is an EDM if and only if its eigenspectrum belongs to a spectral cone for EDM N We will see spectral cones are not unique In the chapter EDM cone we explain the geometric relationship betweenthe EDM cone two positive semidefinite cones and the elliptope We illustrate geometric requirements in particular for projection of a candidate matrixon a positive semidefinite cone that establish its membership to the EDM cone The faces of the EDM cone are described but still open is the question whether all its faces are exposed as they are for the positive semidefinite cone The classic Schoenberg criterion relating EDM and positive semidefinite cones isrevealed to be a discretized membership relation a generalized inequality a new Farkas like lemma between the EDM cone and its ordinary dual A matrix criterion for membership to the dual EDM cone is derived thatis simpler than the Schoenberg criterion We derive a new concise expression for the EDM cone and its dual involvingtwo subspaces and a positive semidefinite cone Semidefinite programming is reviewedwith particular attention to optimality conditionsof prototypical primal and dual conic programs their interplay and the perturbation method of rank reduction of optimal solutions extant but not well known We show how to solve a ubiquitous platonic combinatorial optimization problem from linear algebra the optimal Boolean solution x to Ax b via semidefinite program relaxation A three dimensional polyhedral analogue for the positive semidefinite cone of 3X3 symmetricmatrices is introduced a tool for visualizing in 6 dimensions In EDM proximitywe explore methods of solution to a few fundamental and prevalentEuclidean distance matrix proximity problems the problem of finding that Euclidean distance matrix closestto a given matrix in the Euclidean sense We pay particular attention to the problem when compounded with rank minimization We offer a new geometrical proof of a

famous result discovered by Eckart Young in 1936 regarding Euclideanprojection of a point on a subset of the positive semidefinite cone comprising all positive semidefinite matriceshaving rank not exceeding a prescribed limit rho We explain how this problem is transformed to a convex optimization for any rank rho **Optimality Conditions in Convex Optimization** Anulekha Dhara,Joydeep Dutta,2011-10-17 Optimality Conditions in Convex Optimization explores an important and central issue in the field of convex optimization optimality conditions It brings together the most important and recent results in this area that have been scattered in the literature notably in the area of convex analysis essential in developing many of the important results in this book and not usually found in conventional texts Unlike other books on convex optimization which usually discuss algorithms along with some basic theory the sole focus of this book is on fundamental and advanced convex optimization theory Although many results presented in the book can also be proved in infinite dimensions the authors focus on finite dimensions to allow for much deeper results and a better understanding of the structures involved in a convex optimization problem They address semi infinite optimization problems approximate solution concepts of convex optimization problems and some classes of non convex problems which can be studied using the tools of convex analysis They include examples wherever needed provide details of major results and discuss proofs of the main results **Lectures on Modern Convex Optimization** Aharon Ben-Tal,Arkadi Nemirovski,2001-01-01 Here is a book devoted to well structured and thus efficiently solvable convex optimization problems with emphasis on conic quadratic and semidefinite programming The authors present the basic theory underlying these problems as well as their numerous applications in engineering including synthesis of filters Lyapunov stability analysis and structural design The authors also discuss the complexity issues and provide an overview of the basic theory of state of the art polynomial time interior point methods for linear conic quadratic and semidefinite programming The book s focus on well structured convex problems in conic form allows for unified theoretical and algorithmical treatment of a wide spectrum of important optimization problems arising in applications *Convex Analysis and Optimization* Dimitri Bertsekas,Angelia Nedic,Asuman Ozdaglar,2003-03-01 A uniquely pedagogical insightful and rigorous treatment of the analytical geometrical foundations of optimization The book provides a comprehensive development of convexity theory and its rich applications in optimization including duality minimax saddle point theory Lagrange multipliers and Lagrangian relaxation nondifferentiable optimization It is an excellent supplement to several of our books Convex Optimization Theory Athena Scientific 2009 Convex Optimization Algorithms Athena Scientific 2015 Nonlinear Programming Athena Scientific 2016 Network Optimization Athena Scientific 1998 and Introduction to Linear Optimization Athena Scientific 1997 Aside from a thorough account of convex analysis and optimization the book aims to restructure the theory of the subject by introducing several novel unifying lines of analysis including 1 A unified development of minimax theory and constrained optimization duality as special cases of duality between two simple geometrical problems 2 A unified development of conditions for existence of solutions of convex optimization
