

Chapter 10.10 From DNA to Protein Synthesis

Problems

What percentage of total cell protein is protein?

Background

Genetic proteins are the main structural components of living cells. In addition, they also are involved in metabolism and reproduction and other "life" functions. The specific sequence of amino acids in the protein is determined by the sequence of nucleotides in the DNA. The amino acids are joined together by peptide bonds to form a polypeptide chain. The sequence of amino acids in the polypeptide chain determines the structure and function of the protein.

Explain how you will determine the sequence of amino acids in a protein.

Methodology

Experimental Design

Pre-Lab Questions

1. Describe the process of protein synthesis. How does the DNA sequence determine the amino acid sequence of the protein?
 The amino acid sequence is determined by the DNA sequence. The DNA sequence is transcribed into mRNA, which is then translated into a protein. The amino acid sequence of the protein is determined by the sequence of nucleotides in the mRNA.
2. Compare and contrast the two types of protein synthesis. How do they differ?
 The two types of protein synthesis are transcription and translation. Transcription is the process of copying a segment of DNA into mRNA. Translation is the process of using the mRNA to synthesize a protein.
3. Explain how the genetic code is used to determine the amino acid sequence of a protein.
 The genetic code is a set of rules that determines how the sequence of nucleotides in a gene is translated into the sequence of amino acids in a protein. Each three-nucleotide sequence, called a codon, specifies a particular amino acid.
