Chapter 4 — Handling User input

1. Create a Web form to help in creating "Jumble" puzzles. Create a form that has four input fields named Word1, Word2, Word3, and Word4, as well as "Reset" and "Submit" buttons. Create a form processing script that verifies that all four words are entered, and that all four are between 4 and 7 characters long. Once all the words have been verified as correct, use the strtoupper() and str_shuffle() functions to produce four jumbled sets of letters. (two-part form)

    a. Create a new document in your text editor. Type the <!DOCTYPE> declaration, <html> element, header information, and <body> element.

    b. Add the following XHTML form tags in the document body:

    ```
    <form action="chapter_04_hw_01_process.php" method="post">
    Word 1:  <input type="text" name="Word1" /><br />
    Word 2:  <input type="text" name="Word2" /><br />
    Word 3:  <input type="text" name="Word3" /><br />
    Word 4:  <input type="text" name="Word4" /><br />
    <input type ="reset" value = "Clear Form" /> 
     <input type="submit" name="Submit" value="Send Form" />
    </form>
    ```

    c. Save the document as chapter_04_hw_01.html

    d. Create a new document in your text editor. Type the <!DOCTYPE> declaration, <html> element, header information, and <body> element.

    e. Add the opening and closing tags for the PHP script section in the body of the document:

    ```
    <?php
    ?>
    ```

    f. Add the displayError() function to the script section. This function displays the error message, and takes two parameters: $fieldName, which is the name of the field as it appears on the Web form, and $errorMsg, which describes the error for the user. There is no return value for this function.

    ```
    function displayError($fieldName, $errorMsg) {
        global $errorCount;
        echo "Error for \"$fieldName\": $errorMsg<br />";
        ++$errorCount;
    ```
