Simulating Combustion Günter P. Merker,Christian Schwarz,Gunnar Stiesch,Frank Otto,2005-12-17 The numerical simulation of combustion processes in internal combustion engines including also the formation of pollutants has become increasingly important in the recent years and today the simulation of those processes has already become an indispensable tool when developing new combustion concepts While pure thermodynamic models are well established tools that are in use for the simulation of the transient behavior of complex systems for a long time the phenomenological models have become more important in the recent years and have also been implemented in these simulation programs In contrast to this the three dimensional simulation of in cylinder combustion i e the detailed integrated and continuous simulation of the process chain injection mixture formation ignition heat release due to combustion and formation of pollutants has been significantly improved but there is still a number of challenging problems to solve regarding for example the exact description of processes like the structure of turbulence during combustion as well as the appropriate choice of the numerical grid While chapter 2 includes a short introduction of functionality and operating modes of internal combustion engines the basics of kinetic reactions are presented in chapter 3 In chapter 4 the physical and chemical processes taking place in the combustion chamber are described Chapter 5 is about phenomenological multi zone models and in chapter 6 the formation of pollutants is described

Combustion Engines Development Günter P. Merker,Christian Schwarz,Rüdiger Teichmann,2011-09-24 Combustion Engines Development nowadays is based on simulation not only of the transient reaction of vehicles or of the complete drivetrain but also of the highly unsteady processes in the carburation process and the combustion chamber of an engine Different physical and chemical approaches are described to show the potentials and limits of the models used for simulation

Modeling Engine Spray and Combustion Processes Gunnar Stiesch,2013-06-29 The utilization of mathematical models to numerically describe the performance of internal combustion engines is of great significance in the development of new and improved engines Today such simulation models can already be viewed as standard tools and their importance is likely to increase further as available computer power is expected to increase and the predictive quality of the models is constantly enhanced This book describes and discusses the most widely used mathematical models for in cylinder spray and combustion processes which are the most important subprocesses affecting engine fuel consumption and pollutant emissions The relevant thermodynamic fluid dynamic and chemical principles are summarized and then the application of these principles to the in cylinder processes is explained Different modeling approaches for the each subprocesses are compared and discussed with respect to the governing model assumptions and simplifications Conclusions are drawn as to which model approach is appropriate for a specific type of problem in the development process of an engine Hence this book may serve both as a graduate level textbook for combustion engineering students and as a reference for professionals

employed in the field of combustion engine modeling The research necessary for this book was carried out during my employment as a postdoctoral scientist at the Institute of Technical Combustion ITV at the University of Hannover Germany and at the Engine Research Center ERC at the University of Wisconsin Madison USA

Mixture Formation in Internal Combustion Engines Carsten Baumgarten,2006-09-28 A systematic control of mixture formation with modern high pressure injection systems enables us to achieve considerable improvements of the combustion process in terms of reduced fuel consumption and engine out raw emissions However because of the growing number of free parameters due to more flexible injection systems variable valve trains the application of different combustion concepts within different regions of the engine map etc the prediction of spray and mixture formation becomes increasingly complex For this reason the optimization of the in cylinder processes using 3D computational fluid dynamics CFD becomes increasingly important In these CFD codes the detailed modeling of spray and mixture formation is a prerequisite for the correct calculation of the subsequent processes like ignition combustion and formation of emissions Although such simulation tools can be viewed as standard tools today the predictive quality of the sub models is constantly enhanced by a more accurate and detailed modeling of the relevant processes and by the inclusion of new important mechanisms and effects that come along with the development of new injection systems and have not been considered so far In this book the most widely used mathematical models for the simulation of spray and mixture formation in 3D CFD calculations are described and discussed In order to give the reader an introduction into the complex processes the book starts with a description of the fundamental mechanisms and categories of fuel injection spray break up and mixture formation in internal combustion engines

Analysis of Injection Processes in an Innovative 3D-CFD Tool for the Simulation of Internal Combustion Engines Marlene Wentsch,2018-05-16 Due to the large number of influencing parameters and interactions the fuel injection and therewith fuel propagation and distribution are among the most complex processes in an internal combustion engine For this reason injection is usually the subject to highly detailed numerical modeling which leads to unacceptably high computing times in the 3D CFD simulation of a full engine domain Marlene Wentsch presents a critical analysis optimization and extension of injection modeling in an innovative fast response 3D CFD tool that is exclusively dedicated to the virtual development of internal combustion engines About the Author Marlene Wentsch works as research associate in the field of 3D CFD simulations of injection processes at the Institute of Internal Combustion Engines and Automotive Engineering IVK University of Stuttgart Germany
