Phase II Helmut T. Zwahlen,2009 This project contains three major parts In the first part a digital computer simulation model was developed with the aim to model the traffic through a freeway work zone situation The model was based on the Arena simulation software and used cumulative interarrival times as the input Its aim was to determine the traffic volumes through the work zone and the queue lengths in advance of lane restrictions The program was designed to handle up to 15 miles in length up to six lanes and up to 20 entrance and exit ramps The developed program has not been validated due to the lack of reliable field data and the program appears to produce unreasonably short queue lengths and low exit ramp traffic counts compared to the input traffic data for cases where the exit ramps are spaced closely together In the second part a diversion analysis was performed to determine the effects of closed ramps The work zone sites were assigned by Ohio Department of Transportation and the diversion effects for these situations were in one case very minimal and in the other case as expected traffic shifted to the next open exit ramp In the third part guidelines for ramp management and ramp metering were established on a 24 7 basis giving special considerations to freeway mainline throughput and local traffic access to freeway **Discrete-event System Simulation** Jerry Banks,2010 For junior and senior level simulation courses in engineering business or computer science *Discrete Event System Simulation* examines the principles of modeling and analysis that translate to all software tools rather than a particular software tool This language independent text explains the basic aspects of the technology including the proper collection and analysis of data the use of analytic techniques verification

and validation of models and designing simulation experiments It offers an up to date treatment of simulation of manufacturing and material handling systems computer systems and computer networks Students and instructors will find a variety of resources including simulation source code for download additional exercises and solutions web links and errata at the associated website <http://dmnicol.web.engr.illinois.edu/bcnn/index.html>

Today ,2006 SA Mining ,2005-05 Standard & Poor's Creditweek ,1994 Improved Work Zone Design Guidelines and Enhanced Model of Travel Delays in Work Zones Helmut T. Zwahlen,2006 The project focuses on two major issues the improvement of current work zone design practices and an analysis of vehicle interarrival time IAT and speed distributions for the development of a digital computer simulation model for queues and travel delays in work zones Important considerations in the development of work zone design guidelines include guidance delineation and the safety of workers and drivers A nationwide survey of current work zone best practices was conducted Based on the review of the existing ODOT guidelines superior practices available in other states relevant research and professional judgment of personnel involved in work zone activities a set of guidelines for work zone design are proposed It is anticipated that these research findings will result in the better design of work zones which will minimize traffic delays and improve safety In the second part of the project trailers each using two Wavetronix microwave radar units in side fire mode were developed to nonintrusively measure traffic The traffic was measured at six work zones sites with different types of lane configurations at different freeways in Ohio Traffic on the road was also independently measured using video and radar and the results compared to records from the trailers to verify that the trailers were measuring the traffic with reasonable accuracy IAT data of successive vehicles in freeflowing traffic ahead of work zones were analyzed and IAT distributions were generated as a function of the traffic volume for each lane and relationships between traffic volumes and cumulative IAT distributions were established allowing a direct conversion from hourly traffic counts to corresponding cumulative IAT distributions This conversion method produces fairly accurate cumulative IAT distributions for selected hourly traffic volumes It was also found that the same cumulative IAT distribution can be used to model the free flowing traffic at other freeway locations in Ohio which means that the IAT distributions are portable and scalable and a microscopic digital computer simulation model based on queueing theory may be developed to investigate traffic delays in work zones
