Optimizing Solutions for Real-Life Problems Nilanjan Dey,2025-06-20 This book explores various optimization techniques that can be used to address problems in the real world These problems can be found in healthcare engineering manufacturing and many other fields In many real world situations from business to science optimization techniques are similar to problem solving tools They help us make the best choices by considering limitations constraints and what we are trying to achieve objectives These techniques sift through all the possibilities and find the most effective option Optimization is similar to a toolbox filled with different problem solving methods such as linear programming or genetic algorithms These

tools help us make better decisions about allocating resources across many different fields They do this by finding the most efficient and effective solutions considering all the limitations and goals involved

A Reformulation-Linearization Technique for Solving Discrete and Continuous Nonconvex Problems Hanif D. Sherali,W. P. Adams,2013-04-17 This book deals with the theory and applications of the Reformulation Linearization Convexification Technique RL T for solving nonconvex optimization problems A unified treatment of discrete and continuous nonconvex programming problems is presented using this approach In essence the bridge between these two types of nonconvexities is made via a polynomial representation of discrete constraints For example the binariness on a 0 1 variable x can be equivalently J expressed as the polynomial constraint $x^2 - x = 0$ The motivation for this book is J J the role of tight linear convex programming representations or relaxations in solving such discrete and continuous nonconvex programming problems The principal thrust is to commence with a model that affords a useful representation and structure and then to further strengthen this representation through automatic reformulation and constraint generation techniques As mentioned above the focal point of this book is the development and application of RL T for use as an automatic reformulation procedure and also to generate strong valid inequalities The RLT operates in two

phases In the Reformulation Phase certain types of additional implied polynomial constraints that include the aforementioned constraints in the case of binary variables are appended to the problem The resulting problem is subsequently linearized except that certain convex constraints are sometimes retained in XV particular special cases in the Linearization Convexification Phase This is done via the definition of suitable new variables to replace each distinct variable product term The higher dimensional representation yields a linear or convex programming relaxation The Art of Modeling with Spreadsheets Stephen G.
