Best Practices for Commercial Roof-Mounted Photovoltaic System Installation Rosalie Wills, James A. Milke, Sara Royle, Kristin Steranka, 2015-05-22 This SpringerBrief presents information on a wide variety of hazards and the damage potential caused by installation of a photovoltaic PV system. The current installation practices for PV systems on roofs create electrical, fire, structural, and weather-related hazards that do not comply with current codes, standards, and guidance documents. Potential dangers include structural loading, wind loads, hail, snow, debris accumulation, seismic hazards, firefighting hazards, and electrical hazards. Despite the increased popularity of PV systems after the environmental movement, research shows that the costs of installing PV systems outweigh the benefits. Hazards of PV systems on roofs have caused several incidents in the United States, the most notable in Bakersfield, California, and Mount Holly, North Carolina. Designed for fire engineers and professionals, *Best Practices for Commercial Roof Mounted Photovoltaic System Installation* offers recommendations to set up PV systems safely and sustainably.

Real-time POD-CFD Wind-Load Calculator for PV Systems ,2014 The primary objective of this project is to create an accurate web based real time wind load calculator This is of paramount importance for 1 the rapid and accurate assessments of the uplift and downforce loads on a PV mounting system 2 identifying viable solutions from available mounting systems and therefore helping reduce the cost of mounting hardware and installation Wind loading calculations for structures are currently performed according to the American Society of Civil Engineers Structural Engineering Institute Standard ASCE SEI 7 the values in this standard were calculated from simplified models that do not necessarily take into account relevant characteristics such as those from full 3D effects end effects turbulence generation and dissipation as well as minor effects derived from shear forces on installation brackets and other accessories This standard does not include provisions that address the special requirements of rooftop PV systems and attempts to apply this standard may lead to significant design errors as wind loads are incorrectly estimated Therefore an accurate calculator would be of paramount importance for the preliminary assessments of the uplift and downforce loads on a PV mounting system identifying viable solutions from available mounting systems and therefore helping reduce the cost of the mounting system and installation The challenge is that although a full fledged three dimensional computational fluid dynamics CFD analysis would properly and accurately capture the complete physical effects of air flow over PV systems it would be impractical for this tool which is intended to be a real time web based calculator CFD routinely requires enormous computation times to arrive at solutions that can be deemed accurate and grid independent even in powerful and massively parallel computer platforms This work is expected not only to accelerate solar deployment nationwide but also help reach the SunShot Initiative goals of reducing the total installed cost of solar energy systems by 75% The largest percentage of the total installed cost of solar energy system is associated with balance of system cost with up to 40% going to soft costs which include customer acquisition financing contracting permitting interconnection inspection installation performance operations and maintenance The calculator that is being

developed will provide wind loads in real time for any solar system designs and suggest the proper installation configuration and hardware and therefore it is anticipated to reduce system design installation and permitting costs [Science Abstracts](#),1993 [Study of Wind Loads Applied to Rooftop Solar Panels](#) Jennifer Davis Harris,2013 [Актуальные проблемы демографического развития Санкт-Петербурга](#),2004 [Numerical Simulation of Wind Load on Roof Mounted Solar Panels](#) Yuanming Yu,2012 [Wind Loads on Flat Plate Photovoltaic Array Fields. Phase II. Final Report](#),1979 This report describes a theoretical study of the aerodynamic forces resulting from winds acting on flat plate photovoltaic arrays Local pressure distributions and total aerodynamic forces on the arrays are shown Design loads are presented to cover the conditions of array angles relative to the ground from 20 to 60 variable array spacings a ground clearance gap up to 1 2 m 4 ft and array slant heights of 2 4 m 8 ft and 4 8 m 16 ft Several means of alleviating the wind loads on the arrays are detailed The expected reduction of the steady state wind velocity with the use of fences as a load alleviation device are indicated to be in excess of a factor of three for some conditions This yields steady state wind load reductions as much as a factor of ten compared to the load incurred if no fence is used to protect the arrays This steady state wind load reduction is offset by the increase in turbulence due to the fence but still an overall load reduction of 2 5 can be realized Other load alleviation devices suggested are the installation of air gaps in the arrays blocking the flow under the arrays and rounding the edges of the array Included is an outline of a wind tunnel test plan to supplement the theoretical study and to evaluate the load alleviation devices [Wind Loads on Ground Mounted Solar Panels](#) J. D. Ginger,G.G. Bodhinayake,S. Ingham,2019 **Predicting Wind Loading and Instability in Solar Tracking PV Arrays**,2023 Wind loading and the fluctuating pressure loads it creates on PV panel surfaces are associated with multiple degradation mechanisms and failures Modest wind speeds create reversing loads that can initiate cell cracks and weather cracked cells Stronger wind speeds and extreme weather events can lead to larger scale forces and the aerodynamic instability known as torsional galloping All these effects are dependent on the complex coupling between wind speed panel orientation and a myriad of other hardware and site specific factors In this work we present the latest developments from our work to build an open source high performance computing HPC fluid dynamics solver to predict and mitigate these effects This simulation package allows users to easily specify different array layouts solar tracking angles panel geometries and weather conditions before automatically generating a refined computational mesh and solving for the unsteady loading on each panel surface Small domains e g a single panel row in isolation can be solved on a modern laptop while larger domains or very high fidelity studies can be solved on distributed or HPC resources with minimal modifications to the underlying problem specification We present preliminary case studies obtained using this simulation package and highlight how increased wind speeds combined with sub optimal tracking angles can exacerbate degradation drivers [Wind Loads](#) T. Wind Load Evaluation on Photovoltaic Modules with Flow Deflector Naifu Xu, 2020 The wind load on a photovoltaic system and the effects of adding a flow deflector around the panel are studied The deflector is a reinforce measurement aiming to reduce the aerodynamic wind loads over the PV system which can lower the collapsing risk when the system is under extreme weather conditions Simulations of wind flow over both standalone and arrayed PV modules are performed by using the SST k w turbulence model based on the Reynolds Averaged Navier Stokes equations The inlet velocity profile is specified to describe the conditions representing the flows over a PV system located on a large open terrain with the atmospheric boundary layer The calculations are compared to the data from the published wind flow simulations of the drag and lift force coefficients along the centerline of the module and to the net pressure coefficient on the PV module Further the wind load over the PV system are compared for both stand alone PV module and arrayed PV system with and without a flow deflector placed around it The effects of the wind directions the PV module inclination angles the shapes of the deflector and the spacings between the deflector and the module are investigated The results show that when the inclination angle of the PV module is fixed to 25 placing the deflector around the stand alone module can generate a wind load reduction of up to 40% For an arrayed PV system the wind load is reduced by 8% on the first row modules under the wind direction of 0 Thus the deflector offers an economical solution for reducing the wind load on the existing PV projects without modifying the modules or installation arrangements
