10th European Conference on Mixing Harry E.A. Van den Akker, J.J. Derksen, 2000-06-14 Traditionally fluid mixing and the related multiphase contacting processes have always been regarded as an empirical technology Many aspects of mixing dispersing and contacting were related to power draw but understanding of the phenomena was limited or qualitative at the most In particular during the last decade however plant operation targets have tightened and product specifications have become stricter The public awareness as to safety and environmental hygiene has increased The drive towards larger degrees of sustainability in the process industries has urged for lower amounts of solvents and for higher yields and higher selectivities in chemical reactors All this has resulted in a market pull the need for more detailed insights in flow phenomena and processes and for better verifiable design and operation methods Developments in miniaturisation of sensors and circuits as well as in computer technology have rendered

leaps possible in computer simulation and animation and in measuring and monitoring techniques This volume encourages a leap forward in the field of mixing by the current overwhelming wealth of sophisticated measuring and computational techniques This leap may be made possible by modern instrumentation signal and data analysis field reconstruction algorithms computational modelling techniques and numerical recipes

Three-dimensional Flow in Cavity at Yaw Alex Povitsky, 2001 This study is motivated by three dimensional flows about protrusions and cavities with an arbitrary angle between the external flow and rigid elements The novel type of a building block cavity flow is proposed where the cavity lid moves along its diagonal Case A The proposed case is taken as a typical representative of essentially three dimensional highly separated vortical flows having simple single block rectangular geometry of computational domain Computational results are compared to the previous studies where the lid moves parallel to the cavity side walls Case B These 3 D lid driven cavity flows are studied by numerical modeling using second order upwind schemes for convective terms The volume and plane integrals of primary and transversal momentum are introduced to compare cases in a quantitative way For the laminar flow in the cubic cavity the integral momentum of the secondary flow which is perpendicular to the lid direction is about an order of magnitude larger than that in Case B In Case A the number of secondary vortices substantially depends on the Re number The secondary vortices in the central part of the cavity in Case A distinguishes it from Case B where only corner secondary vortices appear For a rectangular 3 D 3 1 1 cavity the integral momentum of the secondary flow in Case A is an order of magnitude larger than that in the benchmark cases The flow field in Case A includes a curvilinear separation line and non symmetrical vortices which are discussed in the paper The estimated Goertler number is approximately 4 5 times larger in Case A than that in Case B for the same Re number This indicates that in Case A the flow becomes unsteady for smaller Re numbers than in Case B For developed turbulent flow in the cubic cavity the yaw effect on amplification of secondary flow is as strong as that for the laminar flow despite the more complex vortical flow pattern in benchmark case B

Innovative Design, Analysis and Development Practices in Aerospace and Automotive Engineering (I-DAD 2018) U. Chandrasekhar, Lung-Jieh Yang, S.
