NUMBER & CHARACTER

Integer
The integer data type represents whole numbers. It is the most basic of the numeric types. The range of values that can be stored in an integer depends on the implementation, but it is typically between -2,147,483,648 and 2,147,483,647. The integer type is used for counting, indexing, and other operations that require whole numbers.

Float
The float data type represents real numbers. It is used for calculations that require a fractional part. The range of values that can be stored in a float is typically between -3.4e+38 and 3.4e+38. The float type is used for scientific calculations, financial calculations, and other operations that require a fractional part.

Double
The double data type represents real numbers. It is used for calculations that require a fractional part. The range of values that can be stored in a double is typically between -1.7e+308 and 1.7e+308. The double type is used for scientific calculations, financial calculations, and other operations that require a fractional part.

Character
The character data type represents a single character. It is used for storing and manipulating individual characters. The range of values that can be stored in a character is typically between 0 and 255. The character type is used for string processing, file I/O, and other operations that require a single character.

String
The string data type represents a sequence of characters. It is used for storing and manipulating text. The range of values that can be stored in a string is typically between 0 and 255. The string type is used for string processing, file I/O, and other operations that require a sequence of characters.

Boolean
The boolean data type represents a logical value. It is used for storing and manipulating true and false values. The range of values that can be stored in a boolean is typically between 0 and 1. The boolean type is used for conditional operations, loops, and other operations that require a logical value.

Enum
The enum data type represents a set of named constants. It is used for storing and manipulating a set of discrete values. The range of values that can be stored in an enum is typically between 0 and 255. The enum type is used for representing a set of discrete values, such as the days of the week or the colors of the rainbow.

Complex
The complex data type represents a complex number. It is used for calculations that require a real and an imaginary part. The range of values that can be stored in a complex is typically between -1e+308 and 1e+308. The complex type is used for scientific calculations, signal processing, and other operations that require a complex number.

Vector
The vector data type represents a sequence of elements. It is used for storing and manipulating a sequence of elements. The range of values that can be stored in a vector is typically between 0 and 255. The vector type is used for representing a sequence of elements, such as a list of numbers or a set of coordinates.

Matrix
The matrix data type represents a two-dimensional array of elements. It is used for storing and manipulating a two-dimensional array of elements. The range of values that can be stored in a matrix is typically between 0 and 255. The matrix type is used for representing a two-dimensional array of elements, such as a grid of numbers or a set of coordinates.

Array
The array data type represents a sequence of elements. It is used for storing and manipulating a sequence of elements. The range of values that can be stored in an array is typically between 0 and 255. The array type is used for representing a sequence of elements, such as a list of numbers or a set of coordinates.

Map
The map data type represents a collection of key-value pairs. It is used for storing and manipulating a collection of key-value pairs. The range of values that can be stored in a map is typically between 0 and 255. The map type is used for representing a collection of key-value pairs, such as a dictionary or a set of coordinates.

programmer's standard library reference that is as durable as it is portable. This 6 page laminated guide includes a collection of function and class declarations defined as part of the C Standard. The declarations are contained in header files that can be categorized according to the functionality they provide. These essential declarations are used by developers of all skill levels to simplify the process of programming in C. This guide is all script and is organized to find needed script quickly without using screen space or extra clicks; it's already here at your fingertips. As with QuickStudy reference on any subject with continued reference, the format lends itself to memorization. Beginning students or seasoned programmers will find this tool a perfect go-to for the at-a-glance script answer and memory jog you might need. At this price and for the bank of script included, it's an easy add to your programmer's toolbox.
