Load Balancing In Cloud Computing:

Comparative Analysis of Load Balancing Algorithms in Cloud Computing Mohit Tomar,2017 Abstract Cloud computing is a novel trend emerging in Information Technology IT environments with immense infrastructure and resources An integral aspect of cloud computing is load balancing Efficient load balancing in cloud computing ensures effective resource utilization There are two types of load balancers the static load balancer and the dynamic load balancer While both types of load balancers are widely used in the industry they differ in performance In this project the performances of the most widely used static and dynamic load balancers namely the round robin and the throttled are compared Specifically the project examines whether the throttled algorithm takes less time than the round robin algorithm to access data in cloud computing The results show that the throttled algorithm takes less time than the round robin algorithm to access data and that this difference is due to a faultiness in the implementation of the round robin algorithm *Algorithms for Energy Efficient Load Balancing in Cloud Environments* Norman Peitek,2014-12-30 Seminar paper from the year 2013 in the subject Computer Science Commercial Information Technology grade 1 0 Otto von Guericke University Magdeburg Faculty of Computer Science course Recent Topics in Business Informatics language English abstract Energy efficiency has a rising importance throughout society With the growth of large data centers the energy consumption becomes centralized and nowadays takes a significant amount of the overall electricity consumption of a country Load balancing algorithms are able to make an existing infrastructure more efficient without major drawbacks This structured literature research presents the state of the art technology regarding the load balancing approach to make data centers more energy efficient The state of the art approaches are reviewed for techniques improvements and consideration of performance effects **Novel Practices and Trends in Grid and Cloud Computing** Raj, Pethuru,Koteeswaran, S.,2019-06-28 Business and IT organizations are currently embracing new strategically sound concepts in order to be more customer centric competitive and cognitive in their daily operations While useful the various software tools pioneering technologies as well as their unique contributions largely go unused due to the lack of information provided on their special characteristics Novel Practices and Trends in Grid and Cloud Computing is a collection of innovative research on the key concerns of cloud computing and how they are being addressed as well as the various technologies and tools empowering cloud theory to be participative penetrative pervasive and persuasive While highlighting topics including cyber security smart technology and artificial intelligence this book is ideally designed for students researchers and business managers on the lookout for innovative IT solutions for all the business automation software and improvisations of computational technologies Performance Study of Load Balancing Algorithm in Cloud Computing Zhnova Adnan Obaid,2017 Cloud computing is one of the information technology latest development that achieved a huge success and it has taken over the technology world This is due to its ability to provide a broad range of users to access vast amount of virtualized resources scalable services and storage service via using the

Internet Load balancing is an important part functionality of cloud computing because of its ability to stabilize the load and provide maximum optimization Therefore it comes with no surprise that it requires a lot of attention and study During the course of many years vast amount of load balancing algorithms have been developed while some of them were instant success some of them were not It is important to investigate and examine these algorithms to compare contrast and to determine which algorithm works with what This research project is going to study different types of load balancing algorithms such as RR Random No load balancer Max min Min min etc By analyzing the result that is obtained from the simulation from the Riverbed Modeler software to discover and to choose best ways for resource utilization and an efficient load balancing algorithm

Comparative Study of Load Balancing Algorithms in Cloud Computing for Wired and Wireless Networks

Rasti Qasim Ali,2018 Cloud computing is emerging as a modern paradigm for the purpose of accessing manipulating and configuring large scale distributed applications through the Internet The load on the cloud is evolving with the development of new applications in parallel Load balancing algorithms improve the workload to be distributed equally across all nodes and prevents the situation in which some nodes become overloaded while others have the lowest load at the time when a request is made Performance parameters just like CPU utilization and Processing Delay have been studied in order to achieve a higher user satisfaction and resource allocation ratio and ensures that all computing applications perform the same amount of work in the equal time Load balancing is an ideal solution to evenly distribute the load across all the servers by using different types of load balancing algorithms The deployment of cloud computing raises so many challenge tasks such as resource management request handling in cloud environment and the most important one is how to balance load in cloud computing In this project in order to solve the problem of network congestions some load balancing algorithms have been used with the use of a load balancer in two types of technologies wired and wireless OPNET modeler has been used to examine the used load balancing algorithms for different scenarios Moreover the performance of some parameters has been obtained such as CPU utilization on both load balancer and the servers and the processing delay on the load balancer A deep analysis was conducted to investigate these parameters of performance and well studied comparison is

achieved The numerical results proved that using a load balancer decreases the CPU utilization and load on the servers

A. Joshi, 2020 The cloud computing platform has played significant role behind the exponential growth of modern IT industry More and more organizations individuals from various sectors of society are directly or indirectly consuming cloud computing platform Such rising demand for cloud based computing resources has generated requirement of optimized resource management and load balancing Extensive research work is taking place for efficient resource management and load balancing A dynamic approach for virtual machine load balancing is presented here The load balancing mechanism presented here offers better efficiency due to its multi threaded approach *Load Balancing in Multi-cellular 4G Using Cloud Computing* Ravyar Jasim Hamd, 2017 Cloud computing is a technology which enables the sharing of hardware and software resources Service models of the cloud computing are Software as a Service Platform as a service and Infrastructure as a Service Cloud computing is evolving with the system of telecommunication in parallel The integration of mobile and wireless networks with cloud computing will offer ubiquitous services anytime and anywhere to the users However since the number of mobile devices are increasing the demand for services located on servers in the cloud computing will increase too In order to deal with such

situation load balancing is a prominent solution to distribute the load equally to the servers through the use of different types of load balancing algorithms In this thesis the system of telecommunication used to be integrated with cloud computing is the LTE or 4G This system is widely deployed and its integration with cloud computing will raise so many challenges one of the most important one is how to load balance the traffic generated in multi cellular LTE on the servers located in the cloud In this thesis some load balancing algorithms were used in order to solve the problem of congestions in the networks though a load balancer In order to investigate the performance of these algorithms Riverbed network simulator is used Some performance parameters were studied such as CPU utilization on the server user equipments and end to end delay to the servers As well as the case of failure of the servers in cloud computing is studied especially its effect on the ongoing applications represented by http application is analyzed
